EXECUTIVE SUMMARY

AECOM Canada Ltd. (AECOM) has prepared this Foreshore Monitoring Report on behalf of Parkland Refining (B.C.) Ltd. (Parkland) for the Burnaby Refinery. The report summarizes the results of porewater quality monitoring and inspections conducted between January 2020 and March 2021 along the Foreshore area of Burrard Inlet located down slope from the Eastern Impounding Basin (EIB), Area 2 of the Parkland Burnaby Refinery (hereafter referred to as "the Foreshore Site"). This report fulfills reporting requirements in accordance with the Foreshore Passive Treatment System (FPTS) Monitoring and Maintenance Plan (MMP) and meets condition 43 in Permit 16-180 issued by the Vancouver Fraser Port Authority (VFPA). The report also fulfills conditions established by the British Columbia Ministry of Environment and Climate Change Strategy (ENV) and the VFPA in letters provided on April 25, 2018; May 19, 2020; and January 4, 2021 (ENV 2018a; ENV 2020a; VFPA 2021).

The objectives of the program were to:

1. Monitor for the presence of non-aqueous phase liquid (NAPL) and associated contaminants of concern (COCs) in Site porewater[1] monitoring wells.
2. Assess the performance of the FPTS's remedial treatment cells and oleophilic biobarrier (OBB).
3. Maintain the integrity of the Eastern and Western portions of the FPTS by inspecting the protective rip rap and cobbles, repairing or replacement of monitoring wells, and by managing vegetation as required in the FPTS MMP.

Non-Aqueous Phase Liquids and Sheens

Non-aqueous phase liquids (NAPL) and sheen observations in porewater wells have been collected at the Foreshore Site since 2011. Twelve select porewater wells were monitored for NAPL in June 2020 and September 2020. All thirty-three porewater wells were monitored for NAPL[2] in December 2020 and March 2021. During the 2020 and 2021 monitoring events, none of the gauged porewater wells associated with the FPTS contained an observable sheen, or a measurable thickness of NAPL (**Table 1**).

Standards and Contaminants of Concern

Analytical results for porewater samples collected in December 2020 and March 2021 were compared to Risk-Based Management Targets (RBMTs) for contaminants of concern (COCs) associated with the dissolved phase porewater in the vicinity of the former NAPL seeps. The RBMTs were accepted by ENV (formerly referred to as the Ministry of Environment [MoE]) in their letter dated August 28, 2014 (MoE 2014). SLR Consulting Canada Ltd. (SLR) derived RBMTs for the following COCs: benzene, ethylbenzene, toluene, xylenes (BTEX), benzo(a)pyrene, naphthalene, volatile petroleum hydrocarbons in water (VPH_w), light extractable petroleum hydrocarbons in water ($LEPH_w$), copper, and zinc.

Water Quality Results

Concentration data for dissolved phase COCs in porewater have been collected since September 2011 in the former NAPL seep area. Porewater samples were collected from each of the 33 porewater wells located on the Foreshore Site during two annual sampling events, as set out in the amended FPTS Monitoring and Maintenance Plan (AECOM 2019b). The annual sampling events were completed in December 2020 and March 2021. The annual 2021 monitoring event was moved from December 2021 to March 2021 to allow for the collection of porewater samples in the wet season during daylight hours. The analytical results from both events are presented in **Tables 2 to 5** and **Figures 2 to 5** of this report. Data collected since the FPTS was installed are also presented in **Graphs 1 to 8**. Analytical results from porewater samples collected at the Site prior to 2020 are included as **Appendix A**.

[1] The term porewater for post FPTS construction is generally used in this report to include water collected from all four types of Site monitoring wells: Up Gradient, Performance, Sentry, and Compliance Wells

[2] As per ENV Protocol 16, NAPL is considered to be present if a thickness greater than 2 mm is measured in a monitoring well. BC ENV, 2021. Protocol 16. Determining the Presence and Mobility of Nonaqueous Phase Liquids and Odorous Substances (Version 3.0). Victoria, BC. https://www2.gov.bc.ca/assets/gov/environment/air-land-water/site-remediation/docs/protocols/p16_jan_2021_revisions_final_signed.pdf

During the 2020 and 2021 FPTS sampling events, the analytical results from all COCs were compared to their applicable RBMTs:

- Concentrations of BTEX, LEPHw, VPHw, benzo(a)pyrene, naphthalene, dissolved copper and dissolved zinc were below their applicable RBMTs for all samples collected from all 33 porewater wells.

Inspection of the Foreshore Passive Treatment System

The FPTS was visually inspected during quarterly inspection events between January 2020 and March 2021. Inspections indicate there are no significant deficiencies in the FPTS since it was constructed in 2017. The thickness of rip rap was observed to be a minimum of 1.4 meters in depth, with one exception, the rip rap around one of the Contingency Biodegradation Point CBP-6 was observed to have shifted exposing the base of the concrete protector. The layer of cobbles above the oleophilic biobarrier (OBB) surface was observed to be 0.4 meters deep in most places. Inspections have indicated, however, that there has been some thinning of the cobble mat securing the subsurface components of the FPTS at the contact point between the rip rap and cobble interface on the northern extents of the Eastern and Western FPTS. This has resulted in portions of the geogrid becoming exposed in some areas. Thinning of the cobble mat has also been observed on the western extent of the Western FPTS, the eastern extent of the Eastern FPTS. At the Eastern FPTS, the cobble mat is overlain by sand deposits washed from other areas along the foreshore. Vegetation was observed on top of the barrier near the southern boundary of the Foreshore Site. Some small weeds were observed on top of the treatment cells in December 2020, but roots were too shallow to cause damage. Attempts were made to remove vegetation encroaching on the FPTS at the time of inspection. Some overhanging vegetation from the Canadian Pacific Rail Right of Way is encroaching on the FPTS and may need to be cut in the future. Most Sentry and Compliance Wells are covered in barnacles and seaweed. Significant damage to monitoring wells was not observed.

Conclusions and Recommendations

Since construction of the FPTS, monitoring data indicate that the FPTS is operating as designed for mitigating the migration of COCs to ecological receptors and waters of Burrard Inlet based on:

- The absence of sheens or measurable NAPL within the Up Gradient, Performance, Sentry and Compliance Wells of the FPTS.
- Concentrations of dissolved phase COCs in all samples collected from all 33 monitoring are below their applicable RBMTs.

Based on the data collected post-construction of the FPTS, AECOM recommends continuing annual sampling of the FPTS in 2022. The annual sampling event should be completed in March as long as the Foreshore Site will be accessible during daylight hours. Elevated concentrations of LEPHw observed in Up Gradient Well PW17-16 have historically corresponded with sampling events completed in December. Elevated concentrations of COCs in porewater samples collected from Up Gradient and Sentry Wells have historically been observed between December and April. In the most recent 2020 and 2021 sampling, higher concentrations of COCs were observed in March 2021 compared to December 2020. Therefore, in order to monitor the highest concentrations, it is recommended the annual event be conducted in the first three months of 2022.

Based on inspections of the FPTS, AECOM recommends that additional cobbles be placed over exposures of the geogrid/filter fabric down slope of Sentry Wells on both the Eastern and Western FPTS. This recommendation is not considered to be urgent. The current condition of the FPTS is not anticipated to compromise the integrity of the FPTS.

1. INTRODUCTION

AECOM Canada Ltd. (AECOM) has prepared this Foreshore Monitoring Report on behalf of Parkland Refining (B.C.) Ltd. (Parkland) Burnaby Refinery. The report summarizes the results of porewater quality monitoring and inspections conducted between January 2020 and March 2021 along the Foreshore area of Burrard Inlet located down slope from the Eastern Impounding Basin (EIB), Area 2 of the Parkland Burnaby Refinery (hereafter referred to as "the Foreshore Site") (**Figure 1**).

This report fulfills reporting requirements in accordance with the Foreshore Passive Treatment System (FPTS) Monitoring and Maintenance Plan (MMP) (AECOM 2017c), and to meet condition 43 in Permit 16-180 issued by the Vancouver Fraser Port Authority (VFPA 2017). Condition 43 in Permit 16-180 states "*The applicant shall provide VFPA all future environmental monitoring data and reports that are related to the Project until such time that environmental monitoring at the Project site is completed. Monitoring data and reports shall include, at minimum, monitoring as detailed in "Section 8: Performance Verification Plan" of the Applicant's Foreshore Remedial Action Plan dated October 27, 2016, within 30 days of each monitoring period. The Application shall also make monitoring reports available to Aboriginal groups and the BC MoE".* On January 22, 2018, Spencer Chaisson of VFPA responded to Leslie Southern of AECOM and confirmed that Condition 43 of Permit 16-180 has been modified to only require reporting on an annual basis, within 90 business days of the last sampling event of the year.

The FPTS was installed at the Foreshore Site between July 10 through October 30, 2017 and was designed and constructed to be the final remedial action to address any free-phase and dissolved phase hydrocarbon and sheens along the Foreshore of Burrard Inlet. The multicomponent FPTS is comprised larger eastern section and a smaller western section. The FPTS consists of permeable subsurface treatment cells for the mitigation of free-phase non-aqueous phase liquid (NAPL) and dissolved phase hydrocarbons in porewater and contains an oleophilic biobarrier (OBB) for the prevention of sheens. In total, 33 porewater monitoring wells were installed and sampled from 2017 through 2021 and twelve surface water sample locations were sampled in 2017 and 2018 at the Foreshore Site to assess the performance of the FPTS (AECOM 2017b; AECOM 2019a; AECOM 2020a).

In 2018, the British Columbia Ministry of Environment and Climate Change Strategy (ENV) established new conditions for the FPTS MMP in their letter dated April 25, 2018 (ENV 2018a). These conditions were met in the 2018 Annual Foreshore Monitoring Report (AECOM 2019a). In accordance with the recommendations included within the 2018 Annual Foreshore Monitoring Report, modifications were made to the FPTS Monitoring and Sampling Program for 2019 and onward. These changes were detailed in an amendment to the FPTS Monitoring and Maintenance Plan and summarized in the Foreshore 2019 Annual Monitoring Report (AECOM 2019b; AECOM 2020a).

The six conditions for the FPTS MMP requested by ENV in 2018 included the following:

1. Monitoring for the presence of NAPL must be completed in all porewater wells.
2. Porewater samples from the French drains (otherwise known as contingency biodegradation points [CBP]) within the barriers must be collected and analyzed for contaminants of concern (COCs) to verify that they are not acting as preferential pathways for contaminant migration.
3. Any changes to the sampling frequency or termination of parts or the whole of the sampling program requires the approval of ENV.
4. Notification of exceedances of COCs above RBMTs in Compliance Wells and the following Up Gradient and Sentry Wells (PW17-01, PW17-02, PW17-9, PW17-10, PW17-13, PW17-14, PW17-31 and PW17-32) must be provided to ENV in writing within 30 days. Exceedances of Protocol 11 Upper Cap Concentrations (ENV 2021) require immediate verbal and written notification to ENV.
5. Include in the Foreshore Annual Monitoring Reports:
    a. A summary of remedial activities undertaken during the reporting period;

   b. Assessment of overall remediation progress, including evaluation in comparison to the remediation plan and schedule;
   c. Interpretation of current and cumulative results from the monitoring program, including groundwater, surface water, soil, etc., as appropriate; and
   d. Supporting documentation (e.g. analytical reports, tables and figures, records of inspection, maintenance of treatment works, etc.).
6. Submit annual summary report from the date of the completion of the remediation works (October 31st).

Regarding condition No. 2, the collection of porewater samples from the French drains (i.e. CBPs) was discontinued in 2019. ENV was notified of this modification to the sampling program on May 9, 2019 (Parkland, 2019b); ENV provided approval on November 25, 2019 (ENV, 2019b).

Regarding condition No. 4, following recommendations made by AECOM in the Foreshore 2019 Annual Monitoring Report, ENV agreed to reduce the frequency of porewater sampling at the Foreshore Site from semi-annual to annual in 2020. This revision was based on the low concentration and stability of contaminants of concern (COCs) measured at the FPTS over three years and is documented in an email from Lavinia Zanini (ENV) to Chris Boys (Parkland) on May 19, 2020 (ENV 2020a).

Regarding condition No. 6, ENV agreed to coordinate annual reporting to coincide with the VFPA reporting requirements (ENV, 2018b). In January 2021, VFPA agreed to combine the results and analysis of 2020 and 2021 monitoring events into one report to be delivered to VFPA within 90 business days after 2021 event. This is documented in an email from Spencer Chaisson (VFPA) to Chris Boys (Parkland) on January 4, 2021 (VFPA 2021).

The post-construction FPTS monitoring program is detailed in the amended Foreshore MMP (AECOM 2019b).

2. BACKGROUND AND SITE DESCRIPTION

2.1 Previous Investigations

Chevron Canada Limited (Chevron) first observed NAPL seeps on the north, downward slope of the Parkland (formerly Chevron) Burnaby Refinery (Refinery) towards Burrard Inlet during an inspection on April 21, 2010. The seeps were immediately reported by Chevron to the Provincial Emergency Program (now Emergency Management BC) and addressed using soaker pads and booms. The source of the NAPL is unknown but believed to be associated with historical Refinery operations and the north process sewer (decommissioned in June 2011).

A Preliminary Site Investigation (PSI) and a Detailed Site Investigation (DSI) were performed at the Foreshore Site in June 2010 and April 2011, respectively (URS 2011a). The PSI and DSI determined that the NAPL seeps emanated from the sediment near the contact between the overlaying beach sand and underlying colluvium, near the high tide line at the base of the Canadian Pacific Railway (CPR) Right-of-Way (ROW) slope.

Following the DSI, two Interim Remedial Action (IRA) Barriers comprised of a sand-organoclay mixture and a CETCO Reactive Core Mat (RCM) were constructed and installed in the Western Seep Area (WSA) and Eastern Seep Area (ESA) in February and March 2011 (URS 2011b). The Eastern IRA Barrier was refurbished in March and April 2012 by extending the sand-organoclay down slope into the former RCM anchor trench.

Porewater, porewater ecologically active zone (EAZ) samples (containing water from wells that are located from ground surface to 1 metre [m] below ground surface [bgs]), surface water from Burrard Inlet, and ambient air samples, were collected from the Foreshore Site on a regular basis in accordance with the Foreshore Monitoring Plan until February 2015 (URS 2012).

In 2013, it was determined between Chevron(then-owner of the Parkland Burnaby Refinery), AECOM, SLR, and ENV that the two areas of concern on the Foreshore Site down slope of the EIB in Area 2 of the Refinery, would be dealt with through two projects: Project 1 covers the Foreshore Non-aqueous phase liquids (NAPL) former Seep Area, and Project 2 covers the Foreshore outside of the former Seep Area.

Since the development of the original 2012 Foreshore Monitoring Plan, amendments were requested to the sampling frequency and of the monitoring program (URS 2014a) to ENV. The amendments included the following:

1) reduction of bi-monthly NAPL monitoring to monthly for the remainder of 2014 and quarterly in 2015;

2) reduction of porewater sampling in the Project 1 Area to 62 monitoring wells;

3) elimination of porewater sampling in the Project 2 Area (except for monitoring well P18-4.5S);

4) discontinuation of surface water sample collection from the Reference Area; and

5) elimination of ambient air monitoring on the Foreshore Site.

These amendments were approved by ENV in February 2015 (MoE 2015) and carried forward into the 2017 monitoring program prior to construction of the FPTS. In December 2016, the ENV agreed that the concentrations of zinc in porewater from the lone Project 2 Area monitoring well P18-4.5S were attributed to a buried metal object (ENV 2016a), thus the monitoring well was removed from the 2017 monitoring program.

2.1.1 Foreshore Well Decommissioning

In July 2019, 35 historical monitoring wells were decommissioned at the Foreshore Site. The historical wells in Project 1 became redundant due to the installation of new, better protected wells in 2017 as part of the construction of the FPTS. The historical monitoring wells in Project 2 and down slope of the Remote Impounding Basin (RIB) Cell C showed no Refinery-related impacts (URS 2014a, AECOM 2015, AECOM 2016a and AECOM 2016b). Details of the well decommissioning are presented in the Foreshore 2019 Annual Monitoring Report (AECOM 2020a).

2.2 FPTS Construction

Construction of the FPTS was performed from July 10 through October 30, 2017. The FPTS construction followed the ENV supported Foreshore Remedial Action Plan (AECOM 2016c) and in accordance with the Construction Environmental Management Plan (AECOM 2017a).

In summary, the FPTS consists of a larger Eastern section (60 m) and a smaller Western section (20 m) and consists of the following components:

- A subsurface treatment cell with Aquagate+Organoclay;
- An adjacent, down slope subsurface treatment cell with Aquagate+Powdered Activated Carbon;
- Baffles in the treatment cells;
- Contingency delivery piping into the treatment cells;
- Monitoring wells;
- A polyethylene liner to direct groundwater into the treatment cells;
- An Oleophilic Bio-Barrier; and
- Cobbles and a boulder embankment to protect the wells and other components.

In total, 33 porewater wells, divided into four distinct types (Up Gradient Wells, Performance Wells, Sentry Wells and Compliance Wells), were installed at the Foreshore Site in 2017 to assess the performance of

the FPTS (AECOM 2017b). Up Gradient wells are located up gradient of the treatment system, Performance Wells are located within the two treatment cells. Performance Wells are further subdivided into Organoclay Performance (OCP) Wells and Activated Carbon Performance (ACP) Wells; Sentry Wells are located down and cross slope of the treatment cells; and Compliance Wells are located down slope of the FPTS. The wells are presented in **Table A** and on **Figure 1**.

Table A. Foreshore Passive Treatment System Monitoring Wells

Well Type	Well Name
Up Gradient Wells (8)	PW17-01, PW17-04, PW17-09, PW17-13, PW17-16, PW17-21, PW17-26, and PW17-31
Performance Wells (8) OCP (4) ACP (4)	 PW17-05, PW17-17, PW17-22, and PW17-27 PW17-06, PW17-18, PW17-23, and PW17-28
Sentry Wells (8)	PW17-02, PW17-07, PW17-10, PW17-14, PW17-19, PW17-24, PW17-29, and PW17-32
Compliance Wells (9)	PW17-03, PW17-08, PW17-11, PW17-12, PW17-15, PW17-20, PW17-25, PW17-30, and PW17-33

2.3 Site Setting

2.3.1 Geology

The Foreshore Site is located on the southern intertidal foreshore of Burrard Inlet, north of Area 2 of the Burnaby Refinery (**Figure 1**). The former NAPL seeps were located at the base of a north facing benched slope. The upper portion of the slope (Upper Bench) is located within the Refinery fence and is the northern berm of the EIB. The topography north of the fence line drops sharply but flattens out in the vicinity of the Refinery property line (Lower Bench). The topography continues to drop past the Lower Bench to a pair of CPR railway tracks. There is a steep downward embankment north of the railway tracks onto the Foreshore. The intertidal zone then slopes more gently down into the inlet. The area is further described below.

According to the Geological Survey of Canada Map 1484A, Surficial Geology of New Westminster, BC, the Foreshore Site is located in an area of raised marine, deltaic and fluvial deposits (Capilano Sediments) comprised of poorly sorted sand and gravel formed during the Pleistocene. The sand and gravel is underlain by glacial drift deposits (Vashon Drift and Capilano Sediments) comprised of lodgement and minor flow till, lenses and interbeds of sub-stratified drift (sedimentary materials deposited directly from the ice or melt water of a glacier) overlying the Tertiary bedrock. Along the Upper Bench, fill material overlies the glacial materials.

Along the Lower Bench, a layer of fine-grained sand with some gravel and silt colluvium (loose bodies of sediment that have been deposited or built up at the bottom of a slope) overlies a grey to brown sandy silt till layer encountered at depths between 2 and 5 metres below ground surface (m bgs) (URS 2011a).

An approximately 4 m high, steeply sloping embankment (described above) leading up to the railroad, covered with rip rap facing along the lower portions, comprises the southern boundary of the Foreshore Site. The rip rap material is commonly boulders 0.25 to 0.75 m in diameter with scattered pieces up to 2 m in length. Beneath the rip rap, the sediments appeared to be a mixture of the fill, colluvium and till. The DSI determined the surficial geology of the Foreshore Site to be composed of fine to coarse beach sand, underlain by weathered colluvium, colluvium and till (URS 2011a).

2.3.2 Tidal Effects

The local tide fluctuates from approximately 0.5 to 4.5 m above the local datum. During low tides of 0.5 m, approximately 25 m of Foreshore is exposed while during high tides, the entire Foreshore is submerged.

A tidal study completed as part of the DSI (URS 2011a) determined that the porewater elevations parallel the tidal patterns and that mixing was occurring between saline surface water and porewater. A second tidal study was completed in June 2013 (URS 2014b). The results of the June 2013 study agreed with the previous DSI tidal study and noted that porewater generally flows north into Burrard Inlet and is tidally influenced.

2.3.3 Hydrogeology

Porewater on the Foreshore is derived from groundwater flow from up gradient areas, rain infiltration, marine surface water infiltration, and the intermixing of marine surface water through tidal fluctuations. On 1 April 2013, ENV released Technical Guidance 15 and on 1 November 2017, the ENV released Version 2 of Technical Guidance 15[3]. Both guidance documents define subsurface water in the vicinity of the Foreshore Site as follows:

- Groundwater: subsurface water laterally above the highwater mark (upland zone and dilution zone).
- Porewater EAZ and Porewater: subsurface water laterally below the high-water mark (aquatic receiving environment).

Previous reports referred to groundwater and porewater differently. The Foreshore 2013 Second Semi-Annual report (URS 2015) was the first report to be consistent with ENV Technical Guidance 15 and this current report follows these current definitions. The term porewater for post FPTS construction is generally used in this report to include water collected from all four types of Site monitoring wells: Up Gradient Wells, Performance Wells, Sentry Wells and Compliance Wells. As per ENV Procedure 8, Definitions and Acronyms for Contaminated Sites, porewater is defined as “the interstitial water within sediment”.

Given that no hydrological barrier separates the upper porewater EAZ from the lower porewater, these two units are considered one hydrostratigraphic unit and results in this report are not discussed separately.

2.3.4 Regional Climate Conditions

The total precipitation for the area was taken from the Area 1 Eton St Metro Vancouver (Burnaby North) Air Quality and Rainfall Station (T024), located at 49.2875º N, 123.0080º W, at 70 metres above mean sea level and approximately 1.7 kilometres to the west southwest of the Foreshore Site. Approximate total precipitation in 2020 and January to March of 2021 is summarized in **Table B** below:

Table B. Total Precipitation Recorded at Area 1 Eton Street (Burnaby North) Air Quality and Rainfall Station, T024 (Metro Vancouver 2021)

Month	Total Precipitation (mm)	
	2020	2021
January	539.2	146.6
February	152.6	74.2
March	148.6	64.0
April	43	-
May	128	-
June	111.4	-

3. REGULATORY CONTEXT

The *Environmental Management Act* (EMA) was brought into force on July 8, 2004. The applicable regulation under the EMA is the Contaminated Sites Regulation (CSR) updated to February 1, 2021. Federal environmental legislation applicable to Burrard Inlet adjacent to the Foreshore Site includes the *Canada Fisheries Act*. Although CSR standards are applicable to the Foreshore Site, site specific standards were developed through a risk assessment conducted in 2014. This risk assessment forms the basis for the development of the RBMTs applied at the Foreshore Site and discussed below.

3.1 Risk-Based Management Targets (RBMTs)

A Human Health and Ecological Risk Assessment (HHERA) was prepared for the Foreshore Site in February 2014 (SLR 2014a). This HHERA was used to determine Risk-Based Management Targets (RBMTs) for COCs associated with dissolved phase components in porewater associated with the NAPL seeps (SLR 2014b). The RBMTs were accepted by the ENV in their letter dated August 28, 2014 (MoE 2014).

The RBMTs were developed to be protective of aquatic plants and invertebrates at the community level and fish at the population level. The HHERA did not find any significant risk to human health; therefore, RBMTs were not developed for human receptors. SLR reviewed all potential contaminants of concern (PCOCs) for the Foreshore Site and derived RBMTs for the following COCs which were identified to be present at the Foreshore Site: PHC (benzene, toluene, ethylbenzene, xylenes [BTEX], volatile petroleum hydrocarbons in water [VPH_w], and light extractable petroleum hydrocarbons in water [$LEPH_w$]); PAHs (benzo(a)pyrene and naphthalene) and dissolved metals (copper and zinc). The HHERA only identified two metals as porewater COCs; therefore, for this report, the focus of the metals analysis is on copper and zinc.

For monitoring and sampling events completed in 2020 and 2021, porewater samples were compared against their applicable RBMTs per the amended Foreshore Monitoring and Maintenance Plan (AECOM 2019b).

The focus of post construction monitoring is on the water quality reported from Compliance Wells. Further information on the regulatory context of the Foreshore Site is presented in **Appendix B**.

4. OBJECTIVES

Objectives for the Foreshore Site monitoring program in 2020 and 2021 were in accordance with the amended Foreshore MMP (AECOM 2019b) and to meet condition 43 in Permit 16-180 issued by the VFPA (refer to Section 7 in VFPA 2017). The monitoring program also fulfills conditions established by ENV and the VFPA in letters provided on April 25, 2018; May 19, 2020; and January 4, 2021 (ENV 2018a; ENV 2020a; VFPA 2021) (refer to Section 2 of this report). In addition to the two annual sampling events completed in December 2020 and March 2021, five quarterly inspections of the FPTS were completed in March 2020, June 2020, September 2020, December 2020 and March 2021 to check the integrity of the FPTS.

Over the period of January 2020 to March 2021, the post-construction objectives were:

- Monitor for the presence of NAPL and associated COCs in Site monitoring wells;
- Assess the performance of the FPTS's remedial treatment cells and OBB; and,
- Maintain the integrity of the FPTS by checking and, where needed, replacing the protective rip rap and cobbles, repairing or replacement of monitoring wells, and by managing vegetation as required.

5. SCOPE OF WORK

The scope of work for the monitoring programs in 2020 and 2021, in accordance with the amended Foreshore MMP (AECOM 2019b), was as follows:

- Update the Foreshore Site Health and Safety Plan (HASP) based on existing HASPs and specific work area conditions.
- Ensure all required authorizations are obtained and followed.
- Inspect components of the FPTS, including the protective rip rap, protective cobbles, monitoring wells and vegetation and make repairs as necessary.
- Inspect and gauge 12 select Site porewater monitoring wells during quarterly site inspections on the Foreshore Site (starting June 2020).
- Record field observations of colour, clarity, pH, temperature, electrical conductivity, salinity, total dissolved solids (TDS), oxidation reduction potential (ORP), dissolved oxygen (DO), and turbidity.
- Collect porewater samples during two annual sampling events (December 2020 and March 2021) for chemical analysis for COCs: BTEX, VPH_w, $LEPH_w$, benzo(a)pyrene, naphthalene, dissolved copper and dissolved zinc.
- Compare analytical results to RBMTs.
- Prepare this report.

This scope of work was developed jointly by Mr. Chris Boys, P.Geo of Parkland, Ms. Cindy Ott, P.Ag., Geo, P.Chem., and Mr. Michael Gill, P.Eng., CSAP of SLR Consulting Canada Ltd. (SLR), Mr. Robert Horwath, CA PG, and Ms. Leslie Southern, M.Sc., P.Ag., of AECOM.

The scope of work was completed by Mr. Justin Becker, E.I.T., Mr. Aaron Rysdale, Mr. Carny Wong, P.Ag, Ms. Rebecca McGovern, G.I.T., and Mr. Derek Brillinger, G.I.T. The report was prepared by Mr. Derek Brillinger and Ms. Leslie Southern. Senior reviews of this report were conducted by Ms. Bonnie Marks, M.A.Sc., P.Eng., CSAP and Ms. Lesley Reid, M.Eng., P.Eng., CSAP.

5.1 Modification to Scope of Work

In June 2020, the scope of work was modified by Leslie Southern (AECOM) and Christopher Boys (Parkland) to include monitoring of NAPL in 12 select monitoring wells (including eight Up Gradient Wells [PW17-01, PW17-04, PW17-09, PW17-13, PW17-16, PW17-21, PW17-26, and PW17-31] and four Organoclay Performance Wells [PW17-05, PW17-17, PW17-22, and PW17-27]) during quarterly inspections at the Foreshore Site. Each of the 12 wells were monitored for NAPL using an oil/water interface probe along with the collection of combustible headspace vapours using a flame ionization detector (e.g. Eagle RKI). The additional NAPL monitoring events were implemented based on ENV's request (ENV 2020a) to ensure the acceptable performance of the FPTS in between annual monitoring events.

5.2 Sampling Schedule

Annual sampling events were completed in December 2020 and March 2021. In 2021, the sample event was moved to March in order to collect porewater samples in the wet season during daylight hours. During each of these events, 33 porewater monitoring wells in the former NAPL seep areas associated with the FPTS were sampled.

5.2.1 NAPL Monitoring

During annual sampling events in December 2020 and March 2021 all 33 monitoring wells were monitored for NAPL. In June 2020 and September 2020 in conjunction with the quarterly inspection of the FPTS, 12 select monitoring wells were monitored for NAPL.

5.3 Monitoring Well Sampling Methodology

A total of 72 porewater samples, including six field duplicates, were collected in 2020 and 2021.

Porewater monitoring included recording the time of day, depth to water (DTW), depth to product (DTP, if any) and total depth of the well (TD). The DTW and DTP were measured using an interface probe. The interface probe was decontaminated between monitoring wells to prevent cross contamination. Reading of combustible headspace vapours were also collected from the top of the well immediately after the well seal (j-plug) had been removed using a flame ionization detector (Eagle RKI).

As in previous years, porewater samples were collected during low and mid tides when the Foreshore Site is above water. Although desirable to collect the porewater samples during a falling tide, in some cases, due to the short tidal window, a few samples were also collected during a slack tide. During the December 2020 event, the low to mid intertidal zones could only be accessed at night, therefore floodlights were used. Care was taken to direct the lights on the work areas only.

Porewater samples were collected from each monitoring well using dedicated high-density polyethylene and silicone tubing attached to a peristaltic pump, to ensure minimal entrainment of silt in the sample as well as minimal losses of volatile constituents. Prior to sample collection, field parameters including pH, temperature, electrical conductivity, salinity, TDS, ORP, DO, and turbidity were monitored through an approximately 500 mL flow-through cell and documented. Field parameters were recorded once a minimum of one flow-through cell volume (~500 mL) had been removed from the well and parameters had been deemed sufficiently stable by AECOM personnel. During purging and sample collection, care was taken to remove water from near the top of the water column to minimize any disturbance and subsequent entrainment of solids near the base of the well.

Interface probes, used to gauge different sample locations, were decontaminated between locations as follows:

- Washed external and internal surfaces of the sampling equipment with amended water[4]; scrubbed as necessary to remove dirt, grime, grease, and oil;
- Rinsed with de-ionized water; and
- Double rinsed with de-ionized water.

6. RESULTS

The data shown in this report represents monitoring and sampling events completed between January 2020 and March 2021 and are presented in **Tables 1 to 5** and **Figures 2 to 5**. Data collected since the FPTS was installed are also presented in **Graphs 1 to 8**. Porewater and surface water analytical data collected at the Foreshore Site prior to 2020 are included as **Appendix A**.

6.1 Field Monitoring Results

During the monitoring completed between January 2020 and March 2021, none of the gauged wells associated with the FPTS contained a measurable thickness of NAPL[5]. Hydrocarbon films (NAPL with a thickness less than one millimetre) have not been observed in monitoring wells associated with the Foreshore Site since 2013.

Porewater monitoring data and observations are presented in **Table 1**; field parameters are presented in **Table 5**.

6.2 Porewater Analytical Semi-Annual Results

Porewater samples were collected from each of the 33 Foreshore porewater wells during two annual sampling events completed in December 2020 and March 2021.

Porewater samples were analyzed for BTEX, VPH_w, $LEPH_w$, benzo(a)pyrene, naphthalene, dissolved copper, and dissolved zinc. The reported analytical results are summarized on **Tables 2 to 5** and presented on **Figures 2 to 5**. Copies of the 2020 and 2021 analytical laboratory reports are provided in **Appendix C**.

Porewater results were screened against the RBMTs. Data for the 2020 and 2021 sampling events are discussed in the following subsections.

6.2.1 Petroleum Hydrocarbons and Polycyclic Aromatic Hydrocarbons

6.2.1.1 Up Gradient Wells

Concentrations of BTEX, VPHw, LEPHw, benzo(a)pyrene and naphthalene in all porewater samples collected from the eight Up Gradient Wells located within the Eastern and Western FPTS treatment cells were below their respective RBMTs.

6.2.1.2 Performance Wells (OCP and ACP)

Concentrations of BTEX, VPH_w, $LEPH_w$, benzo(a)pyrene and naphthalene in all porewater samples collected from the eight OCP and ACP Wells located within the Eastern and Western FPTS treatment cells were below their respective RBMTs.

[4] Amended water is a 0.5% solution of an environmentally friendly cleaner labelled Liquinox and de-ionized water.

[5] As per ENV Protocol 16, NAPL is considered to be present if a thickness greater than 2 mm is measured in a monitoring well. BC ENV, 2021. Protocol 16. Determining the Presence and Mobility of Nonaqueous Phase Liquids and Odorous Substances (Version 3.0). Victoria, BC. https://www2.gov.bc.ca/assets/gov/environment/air-land-water/site-remediation/docs/protocols/p16_jan_2021_revisions_final_signed.pdf

6.2.1.3 Sentry Wells

Concentrations of BTEX, VPH_w, $LEPH_w$, benzo(a)pyrene and naphthalene in all porewater samples collected from the eight Sentry Wells located cross and down slope of the Eastern and Western FPTS treatment cells were below their respective RBMTs.

6.2.1.4 Compliance Wells

Concentrations of BTEX, VPH_w, $LEPH_w$, benzo(a)pyrene and naphthalene in all porewater samples collected from the nine Compliance Wells located in between, cross and down slope of the Eastern and Western FPTS were below their applicable RBMTs.

6.2.2 Metals Analysis

All porewater samples collected in 2020 and 2021 from the 33 porewater wells contained concentrations of dissolved zinc and copper below their applicable RBMTs.

7. QUALITY ASSURANCE/QUALITY CONTROL

In order to assure the integrity and reliability of the data collected, rigorous quality assurance quality control/ (QA/QC) protocols were observed. QA/QC protocols used by AECOM in undertaking the staged investigation and remediation of the Foreshore Site are presented in **Appendix D**.

No data quality outliers were reported by the laboratory for any parameters with RBMTs. It is AECOM's opinion that the analytical results for all parameters with RBMTs are considered reliable.

7.1 Precision

For the two semi-annual events, a total of six samples were duplicated in the field. Relative percent differences (RPDs) can only be calculated in instances where the concentration for either sample was less than five times the reported detection limit (RDL). For all duplicated samples, the concentrations of parent and duplicate samples were either below the RDL or less than five times the RDL in all but three sets of samples, outlined below:

- Reported concentrations for ethylbenzene in the primary sample and its duplicate (DUP-1), collected from PW17-16 in December 2020, had a calculated RPD of 42%.
- Reported concentrations for VPHw and benzene in the primary sample and its duplicated (DUP-3), collected from PW-16 in March 2021 both had a calculated RPD of 0%.
- Reported concentrations for dissolved copper in the primary sample and its duplicate (DUP-3), collected from PW17-22 in December 2020, had a calculated RPD of 2%.

The BC Environmental Lab Manual (BCELM) provides data quality objectives (DQO) for recommended laboratory duplicate RPDs (ENV 2020b). The BC ENV has provided guidance indicating that field RPDs within 1.5 times the laboratory RPDs as defined in the BCELM are acceptable (ENV 2016b). Therefore, acceptable lab RPDs are as follows:

- Water – Petroleum Hydrocarbons have acceptable laboratory RPDs of 45%; and
- Water – Metals have an acceptable laboratory RPDs of 30%.

All parameters with calculated RPDs were within the acceptable range for RPD values. Based on this guidance and the above results, the calculated RPDs for benzene, ethylbenzene, VPHw and dissolved copper in water are within acceptable limits.

7.2 Accuracy

Analytical accuracy was confirmed in a review of percent recoveries reported in the laboratory reports. Percent recoveries are obtained when the project laboratory analyzes samples with known concentrations and compares their analytical results to the known concentrations. The laboratory provided percent recoveries for the majority of the analyses. The reported Laboratory Control Sample (LCS) recoveries and Matric Spike (MS) sample recoveries for parameters with RBMTs were within laboratory QC limits. It is AECOM's opinion that the analytical results are valid with respect to accuracy.

7.3 Completeness

No samples were invalidated by project laboratory. Completeness for all samples collected for this project was 100%.

8. INSPECTION OF THE FORESHORE PASSIVE TREATMENT SYSTEM

The FPTS was visually inspected during five quarterly inspection events completed on the following dates:

- March 12, 2020
- June 22, 2020
- September 28, 2020
- December 8, 2020
- March 3, 2021

A detailed table of the inspection results has been included as **Table 6** and a photographic log has been included as **Appendix E**.

The inspections indicated that there has been some thinning of the cobble mat at the contact point between the rip rap and cobble interface. This has resulted in portions of the geogrid and geotextile exposed in some areas along the northern extent of both the Eastern and Western FPTS (refer to Photos 1-4 within **Appendix E**). During the most recent inspection, conducted on March 3, 2021, the exposures ranged from approximately 0.24 m to 8.2 m long and 0.02 to 0.6 m wide.

During the inspections completed in December 2020 and March 2021, the rip rap which had been placed around one of the Contingency Biodegradation Points (CBP-6) was observed to have shifted exposing the base of the concrete protector (refer to Photo 6 in **Appendix E**).

As part of the 2020 and 2021 FPTS inspections, test pits were advanced within the cobble mat of the Eastern and Western FPTS. Test pits were advanced to a depth where the liner was encountered or the maximum depth possible where ground conditions allowed for hand digging. Test pits advanced in the Eastern FPTS revealed sand overlying cobbles to a depth of between 0.39 to 0.52 m below grade, where the liner was encountered. Test pits advanced in the Western FPTS revealed sand overlying cobbles to a depth of between 0.38 to 0.63 m below grade, where the liner was encountered. Overall, the inspections indicated that there were no significant deficiencies associated with either the Eastern or Western FPTS.

Vegetation was observed on top of the barrier near Up Gradient Wells. Some small weeds were observed on top of the treatment cells in December, but roots were too shallow to cause damage. Attempts were made to remove vegetation encroaching on the FPTS at the time of inspections. Some overhanging vegetation from the Canadian Pacific Rail Right of Way is encroaching on the FPTS and may need to be

cut in the future. Most Sentry and Compliance Wells are covered in barnacles and seaweed. Significant damage to monitoring wells was not observed.

The rip rap and cobble mat of the FPTS are anticipated to shift over time because of tidal action. The exposed geogrid is being maintained; however, it has become exposed in the areas noted above. No significant concerns were noted during these inspections and the FPTS is performing as designed.

9. DISCUSSION

9.1 Distribution of Exceedances

For FPTS sampling events completed between 2017 and 2021, an exceedance refers to concentrations of BTEX, VPH_w, $LEPH_w$, benzo(a)pyrene, naphthalene, dissolved copper or dissolved zinc above their applicable RBMTs.

There were no exceedances of BTEX, VPHw, LEPHw, benzo(a)pyrene, naphthalene, dissolved copper or dissolved zinc in any samples collected during the 2020 and 2021 FPTS sampling events. Overall, this indicates that the treatment system is effective in addressing dissolved phase hydrocarbons in porewater and is operating as designed.

9.2 Concentration Trends Over Time

9.2.1 Petroleum Hydrocarbons and Polycyclic Aromatic Hydrocarbons

The reported concentrations of LEPHw, VPHw, and benzene have been plotted over time on **Graphs 1 to 8** to demonstrate their trends. For graphs displaying average concentrations, the number of samples used in the calculation of average concentrations for each sampling event is represented by “n” on each graph. Data has been plotted from porewater wells within each of the monitoring areas of the current FPTS, including:

- (A) Up Gradient Wells,
- (B) OCP Wells,
- (C) ACP Wells,
- (D) Sentry Wells, and
- (E) Compliance Wells

Graphs 1A through 1E demonstrate that the concentration of $LEPH_w$, averaged across each well type, was below its RMBT for all 13 sampling events between November 2017 and March 2021.

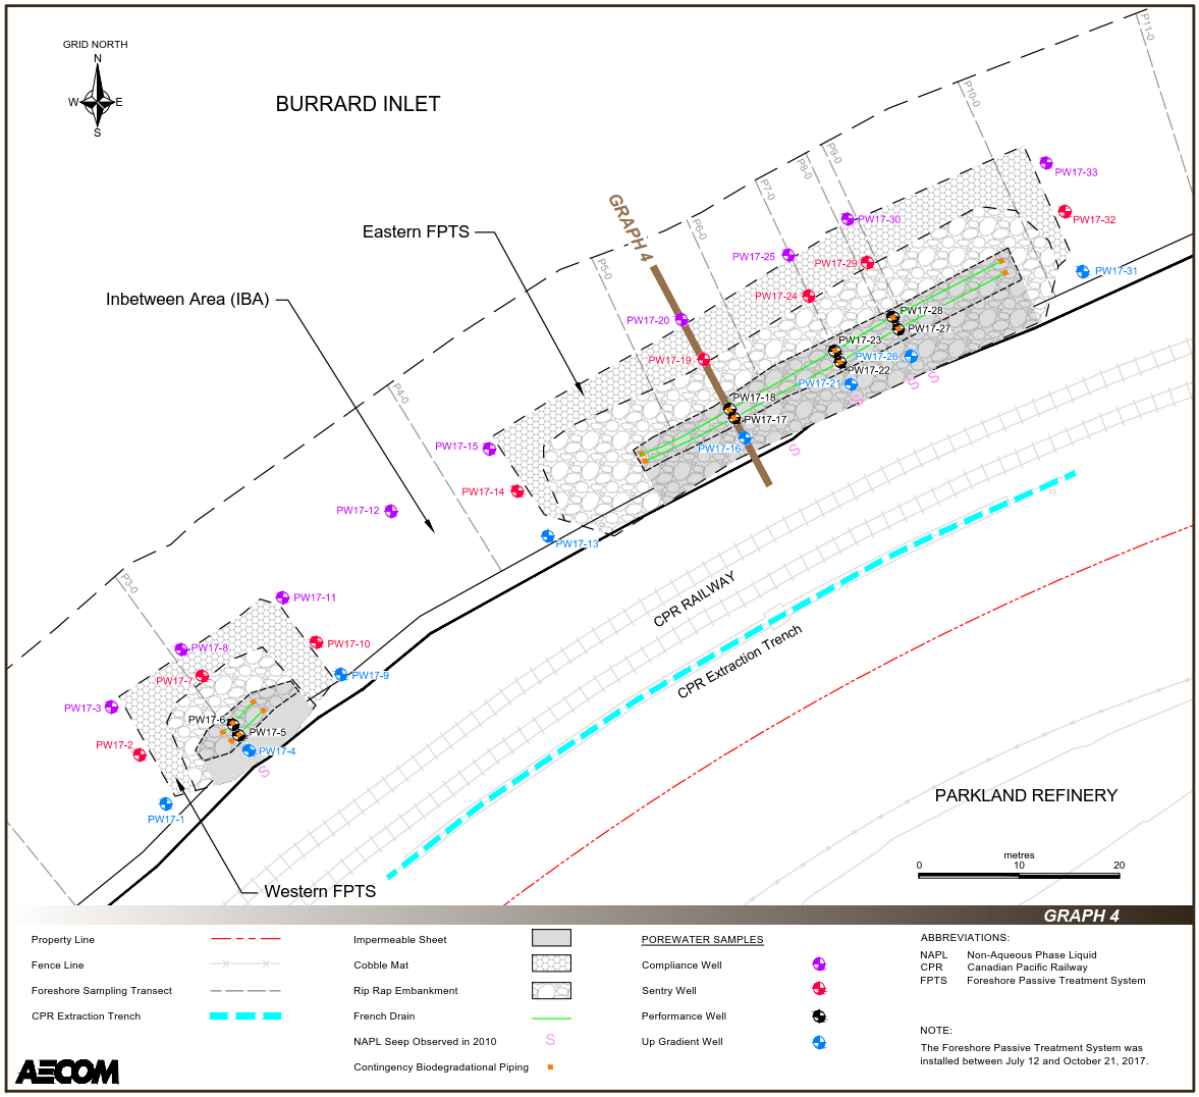
Graph 2 demonstrates that detectable concentrations of VPH_w in porewater were only present in Up Gradient Wells from January 2018 to March 2021 and OCP Wells in March 2018, June 2018, September 2018, December 2018, June 2019, December 2019 and March 2021.This indicates that the FPTS is effective at removing VPH_w from porewater, as concentrations of VPH_w above the RDL were not observed in wells down slope of the FPTS and concentrations of VPH_w generally decrease with travel through the FPTS.

Graph 3 indicates that average concentrations of benzene in porewater generally decrease after porewater has been transported through the FPTS, from Up Gradient to Sentry and Compliance Wells. During the last three sampling events, the average concentration of benzene has been higher in Sentry Wells compared to OCP Wells. During the same three sampling events, the average concentrations of benzene has been higher in OCP Wells compared to Up Gradient Wells. At this time, it is unclear why benzene concentrations are higher in OCP and Sentry Wells compared to Up Gradient Wells, however, the concentrations observed are significantly lower than the applicable RBMT for benzene.

No detectable concentrations of benzene were reported in any porewater sample collected from an ACP Well. The lack of concentrations of benzene above its RDL from porewater samples collected from ACP Wells and from the Compliance Wells indicate that the activated carbon is efficient at the adsorption of benzene from porewater and the overall trend indicates that the FPTS is performing as designed.

Graph 4 presents concentrations of benzene, $LEPH_w$, and VPH_w in samples collected from porewater wells along a north-south transect through the Eastern FPTS, from Up Gradient Well PW17-16 to Compliance Well PW17-20, as shown in **Figure A** below.

Figure A: Wells included in Graph 4 and Cross section A-A' (Figure 5), a north-south transect through the Eastern FPTS



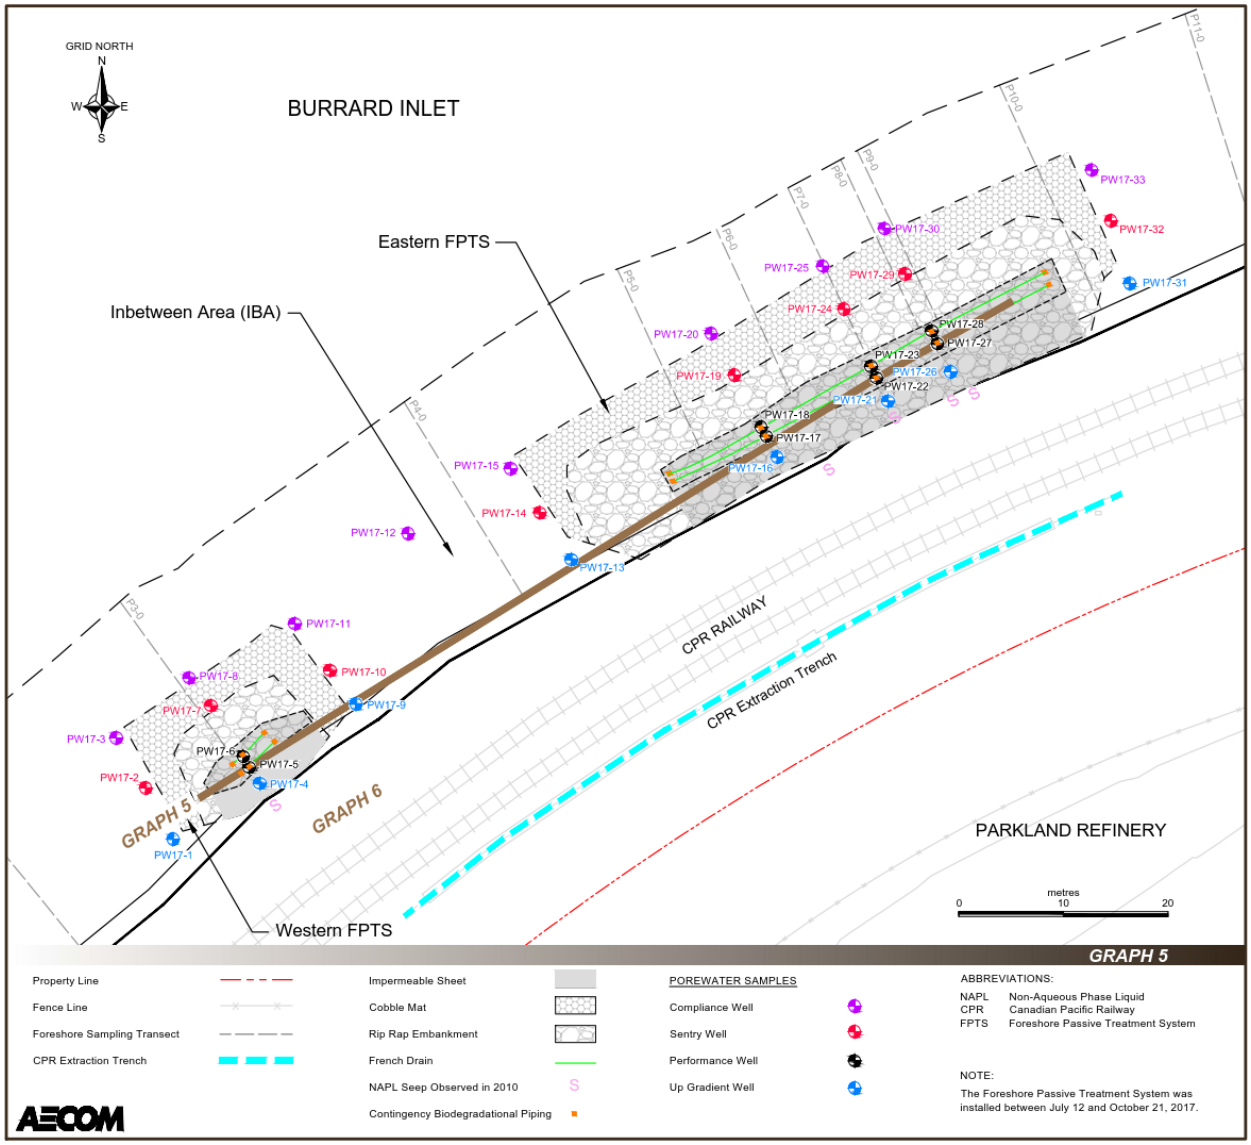
Graph 4 indicates that there are no substantial temporal trends in the concentration of benzene, VPH_w or $LEPH_w$ in porewater over time since the FPTS was installed. The graph does indicate a general decrease in concentrations of VPHw and LEPHw from the Up Gradient Well (PW17-16) to the down slope Compliance Well (PW17-20). Reported benzene concentrations show more variability from the Up Gradient (PW17-16) to Compliance Well (PW17-20). The samples with the highest concentration of benzene reported in March 2021, collected from this transect, were collected from Up Gradient Well PW17-16 (8.44 µg/L) and Sentry Well PW17-19 (8.23 µg/L). Historically, higher benzene concentrations have been observed in porewater samples collected from Sentry Well PW17-19 in sampling events completed during winter and spring. Porewater samples have not been collected in summer months since

June 2019 and, therefore, the graph shows higher benzene concentrations sustained across the last three sampling events.

The graph illustrates that only $LEPH_w$ has exceeded the RBMT in Up Gradient Well PW17-16 in 2018 and 2019. Reported concentrations of benzene, VPHw, and LEPHw were below their respective RBMTs in porewater samples collected from all other wells suggesting that the FPTS is efficient at addressing dissolved phase petroleum hydrocarbons in porewater.

Graph 5 presents concentrations of benzene, VPH_w, and $LEPH_w$ in samples collected from OCP Wells along an west-east transect (PW17-5, PW17-17, PW17-22 and PW17-27) through the Western and Eastern FPTS, as shown in **Figure B** below.

Figure B: Wells included in Graph 5, an east-west transect through Performance (OC) Wells

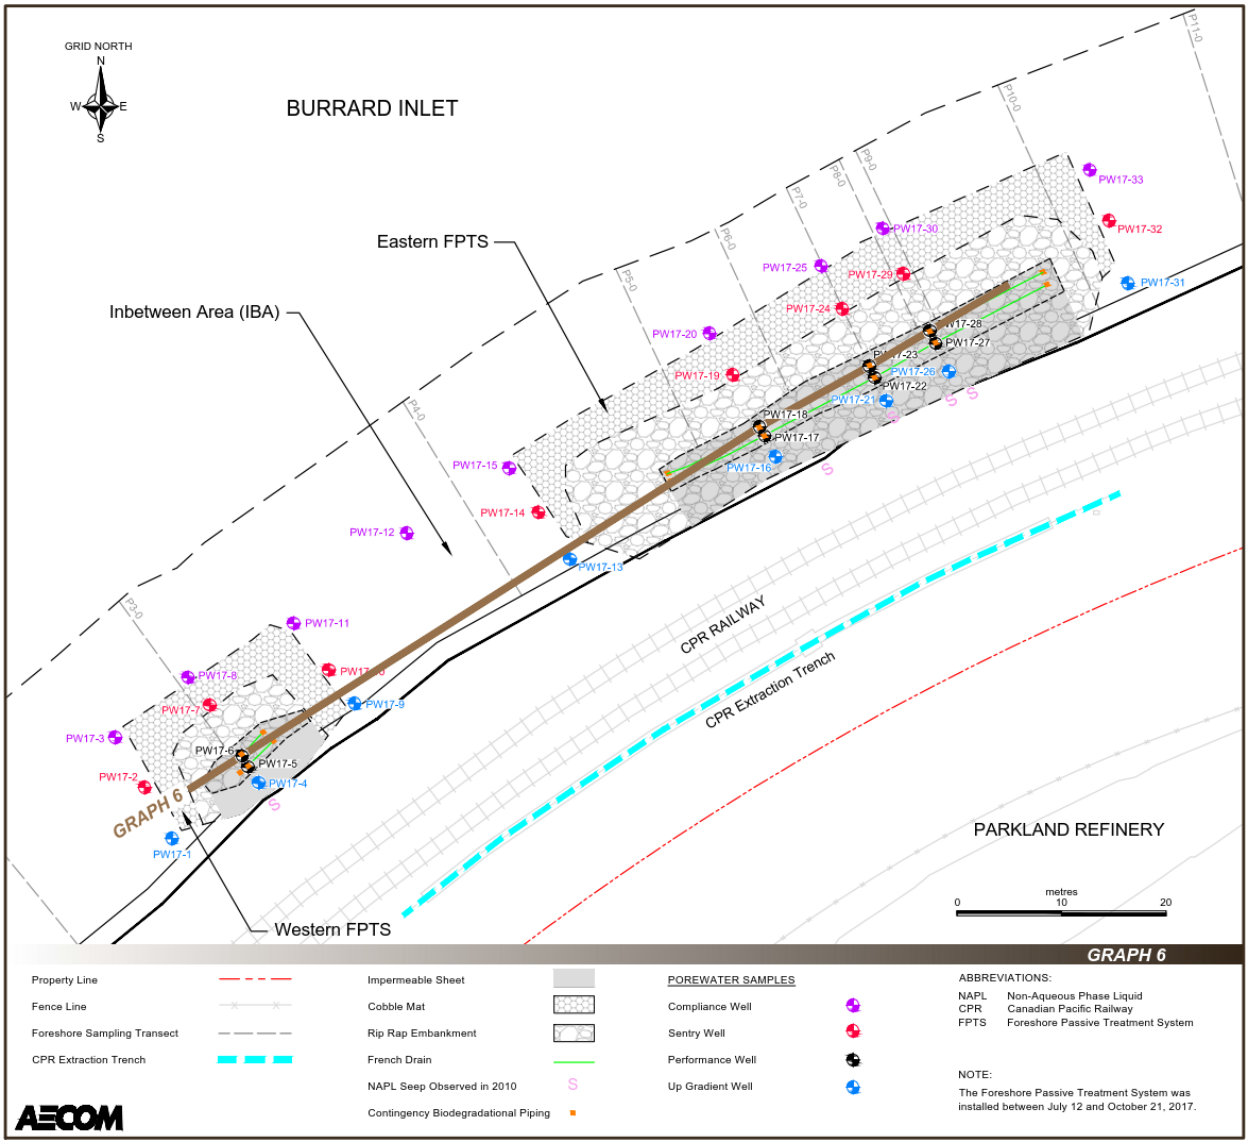


Graph 5 demonstrates that there were elevated concentrations of benzene and VPH_w in porewater samples collected from OCP Well PW17-17, with highest concentrations occurring in samples collected in June 2018.The reported concentration of VPHw and benzene in PW17-17 was higher in the porewater sample collected in March 2021 compared to the sample collected in December 2020. The concentrations of benzene, VPHw, and LEPHw were below their respective RDLs from the Western FPTS. Reportable

concentrations of benzene and VPHw were detected in OCP Wells in the Eastern FPTS but still below their respective RBMTs.

Graph 6 presents concentrations of benzene, VPH_w, and $LEPH_w$ in samples collected from ACP Wells along a west-east transect (PW17-6, PW17-18, PW17-23 and PW17-28), as shown in **Figure C** below.

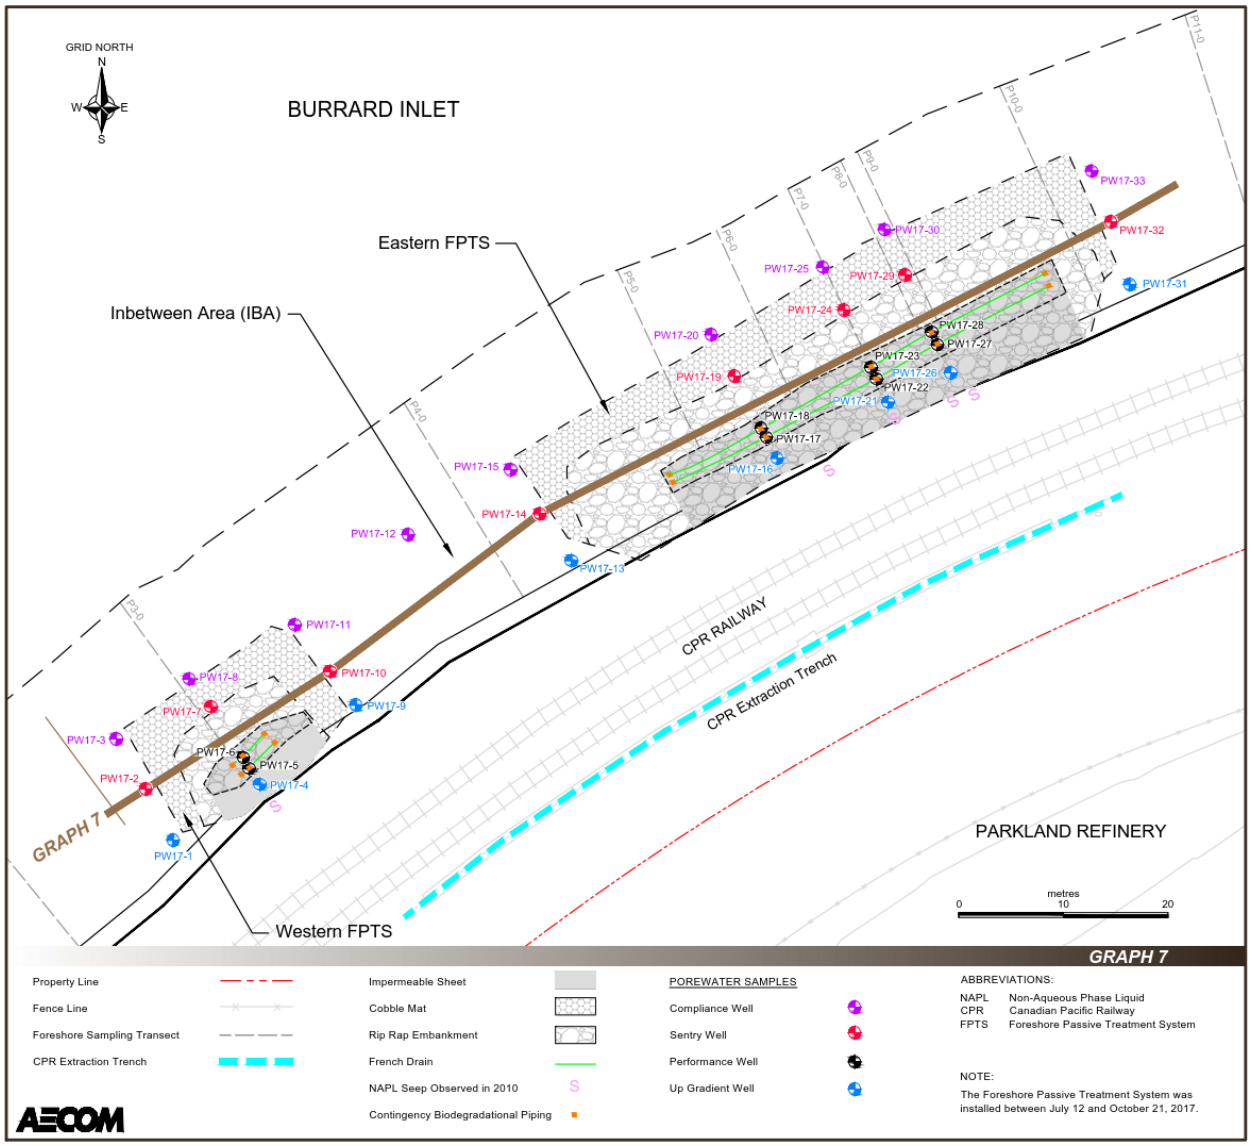
Figure C: Wells included in Graph 6, an east-west transect through Performance (AC) Wells



Graph 6 illustrates that there were no concentrations of benzene, VPH_w, and $LEPH_w$ above their respective RDLs in porewater samples collected from ACP Wells between November 2017 and March 2021. This suggests that that the activated carbon is efficient at the adsorption of PHCs across both the Western and Eastern FPTS.

Graph 7 presents concentrations of benzene, VPH_w and $LEPH_w$ in samples collected from Sentry Wells (PW17-2, PW17-10, PW17-14, and PW17-32) along a west-east transect, as shown in **Figure D** below.

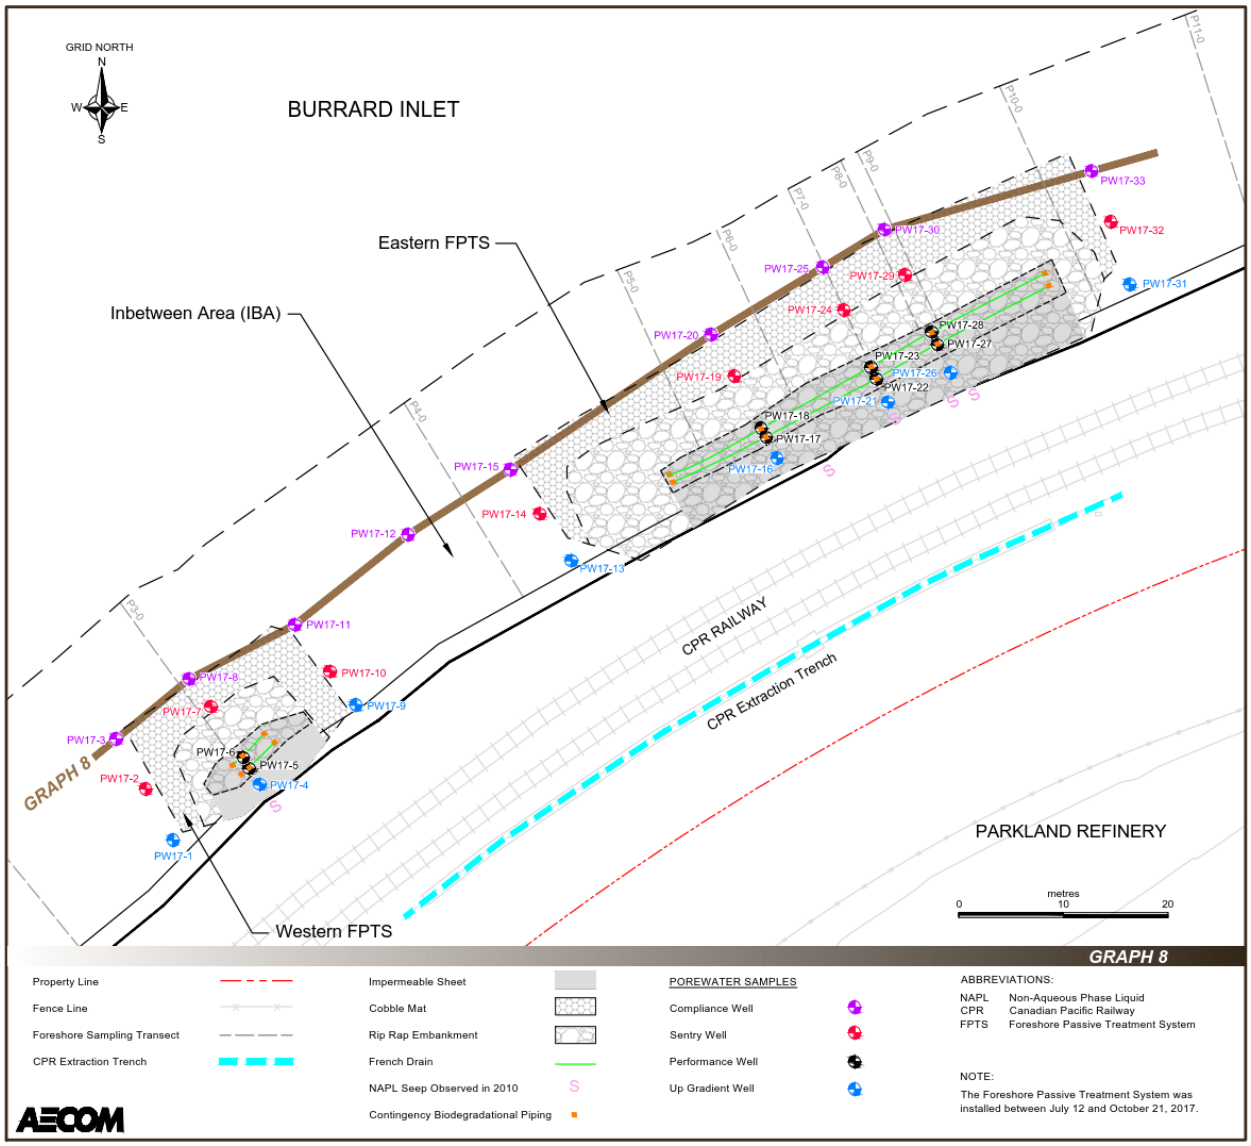
Figure D: Wells included in Graph 7, an east-west transect through Sentry Wells



Graph 7 illustrates that there were no concentrations of benzene, VPH_w and $LEPH_w$ above their respective RDLs in porewater samples collected from any of the graphed Sentry Wells between November 2017 and March 2021, with the exception of $LEPH_w$ in a sample collected from PW17-10 located on the east end of the Western FPTS in December 2018. This sample contained a concentration of $LEPH_w$ above its RBMT. A separate bottle, containing a porewater sample from the same sampling event, was analyzed at the laboratory and contained a concentration of $LEPH_w$ below its RDL. There is no trend associated with this reportable concentration $LEPH_w$ and further analysis of the sample indicated the $LEPH_w$ was likely from either field or laboratory cross-contamination and not representative of porewater conditions on the Foreshore Site (AECOM, 2019a).

Graph 8 presents concentrations of benzene, VPH_w and $LEPH_w$ in samples collected from Compliance Wells (PW17-3, PW17-8, PW17-11, PW17-12, PW17-15, PW17-20, PW17-25, PW17-30 and PW17-33) along a west-east transect, as shown in **Figure E** below.

Figure E: Wells included in Graph 8, an east-west transect through Compliance Wells



Graph 8 illustrates that there were no concentrations of VPH_w or $LEPH_w$ above their respective RDLs in porewater samples collected from any of the Compliance Wells between November 2017 and March 2021. No samples collected from Compliance Wells contained concentrations of benzene above its RDL, with the exception of three samples collected from PW17-30 in November 2017 (0.63 µg/L), December 2017 (0.55 µg/L), and April 2018 (32.5 µg/L). The concentrations of benzene were still far below its RBMT (2,100 µg/L) and, therefore, does not indicate a deficiency in the Eastern FPTS.

9.2.2 Dissolved Metals

AECOM assessed the concentration of dissolved metals in porewater samples collected in 2020 and 2021. Previously reported elevated dissolved copper concentrations detected in the January, February, or September 2018 sampling events were determined to likely be associated with contamination resulting from field filtering samples, or contamination during sample preparation and dilution at the laboratory (AECOM 2019a).

In 2019, 2020 and 2021 none of the porewater samples collected contained concentrations of dissolved copper or dissolved zinc above their respective RBMTs (6.2 and 90 µg/L, respectively). In 2020 and 2021, detectable concentrations of dissolved copper ranged from 0.2 to 6.18 µg/L and detectable concentrations of dissolved zinc ranged from 1.0 to 11.9 µg/L. The concentrations of dissolved copper and dissolved zinc observed in 2020 and 2021 was considerably less than the concentrations observed prior to the FPTS construction, which ranged from 0.2 to 35.9 µg/L and 1.0 to 7,400 µg/L, respectively.

9.3 Status of the FPTS

Since construction of the FPTS, monitoring data indicates that the FPTS is operating as designed for mitigating the migration of COCs to ecological receptors and waters of Burrard Inlet based on:

- The absence of sheens or measurable NAPL within the Up Gradient, Performance, Sentry and Compliance Wells of the FPTS;
- Dissolved phase COCs in all 33 monitoring are below their applicable RBMTs;
- The elevated dissolved copper concentrations detected in porewater in select 2018 sampling events were not observed in 2019, 2020 or 2021. Previous elevated dissolved copper concentrations are considered anomalous and do not appear to be related to the FPTS or Refinery operations; and,
- The monitoring and sampling program completed in 2020 and 2021 confirms that RBMTs have been met.

10. SUMMARY

This 2020 and 2021 monitoring report summarizes monitoring activities conducted January 2020 through March 2021 along the Foreshore Site.

Table C below summarizes the objectives and results from the monitoring activities conducted on the Foreshore Site between January and March 2021.

Table C. Summary of the Objectives and Results from the 2020 and 2021 Foreshore Monitoring Program

Objective	Result
Monitor for the presence of NAPL and associated COCs in Site monitoring wells	During monitoring events between January 2020 and March 2021, none of the porewater wells contained an observable sheen or measurable thickness of NAPL.
	No exceedances of the RBMTs were observed in 2020 or 2021 monitoring activities.
	The $LEPH_w$ exceedance in the porewater sample collected from Up Gradient Well PW17-16 in 2019 was not observed in 2020 and 2021. The previous exceedance does not indicate a lack of performance in the FPTS, as the well it was collected from is located up slope of the FPTS. $LEPH_w$ was not above its RDL in porewater wells located down slope of PW17-16, which provides evidence that the treatment system worked effectively in 2019. All available evidence suggests that the FPTS continued to function as designed from January 2020 to March 2021.
	Concentrations of dissolved copper above the RBMT in PW17-05, PW17-11, PW17-15, PW17-16, PW17-24, PW17-26, PW17-27, and PW17-28 detected during the January, February, and September 2018 sampling events were not observed in 2019, 2020 or 2021. This supports the conclusion that the exceedances were determined to likely be associated with contamination

Objective	Result
	resulting from field filtering samples, or contamination during sample preparation and dilution at the laboratory.
Assess the performance of the FPTS's remedial treatment cells and OBB	In 2020 and 2021, concentrations of PHCs and PAHs were not detected above the RDLs in any of the Compliance Wells. This trend demonstrates that the treatment system is operating as designed. The reported concentrations of COCs were below RBMTs in all samples collected in 2020 and 2021.
Maintain the integrity of the FPTS by checking and, where needed, replacing the protective rip rap and cobbles, repairing or replacement of monitoring wells, and by managing vegetation as required.	All visual inspections of the FPTS indicated that there were no significant deficiencies, including: rip rap thickness; thickness of cobbles above the OBB surface; vegetation growing above the treatment cells or OBB; and significant damage to monitoring wells (some minor chips to well casing and lids observed). Inspections completed in 2020 and 2021 documented ten exposures of the geogrid fabric and geotextile at the contact point between the rip rap and cobble interface of the Eastern and Western FPTS. The rip rap around one of the Contingency Biodegradation Points (CBP-6) was observed to have shifted exposing the base of the concrete protector.

Thirteen sampling events have been completed since construction of the FPTS in 2017. Since 2017, only two wells have reported concentrations above their RBMTs: 1) Up Gradient Well PW17-16, the only well in which the RBMT for LEPHw (300 µg/L) was exceeded (January, February, March, April and December 2018 and December 2019), with an average concentration of 311 µg/L and a maximum of 490 µg/L; and 2) Performance Well PW17-5 contained a concentration of dissolved copper reported above its RBMT (6.2 µg/L) in September 2018, with an average concentration of 3.23 µg/L and a maximum of 15.8 µg/L[6].

Since 2017, detectable concentrations of LEPHw, BTEX, VPHw, benzo(a)pyrene, and/or naphthalene have been found in nineteen (19) porewater wells associated with the Foreshore Site, but at concentrations well below their RBMTs. Concentrations of dissolved copper and/or zinc have been detected in 31 monitoring wells since April, 2018[6], but below their RBMTs, with the one exception previously noted in PW17-5**.** In 2020 and 2021, concentrations of LEPHw, BTEX, VPHw and PAHs were not detected above the RDLs in any of the Compliance Wells; detectable concentrations of dissolved copper and/or zinc were reported in eight of the nine Compliance Wells, but below the applicable RBMTs. The treatment system is effective in addressing dissolved phase hydrocarbons in porewater and is operating as designed.

11. RECOMMENDATIONS

Based on the data collected post-construction of the FPTS, AECOM recommends continuing annual sampling of the FPTS in 2022. Elevated concentrations of LEPHw observed in Up Gradient Well PW17-16 have historically corresponded with sampling events completed in winter and spring months. Elevated concentrations of COCs in porewater samples collected from Up Gradient and Sentry Wells have historically been observed between December and April. In the most recent 2020 and 2021 sampling, higher concentrations of COCs were observed in March 2021 compared to December 2020. Therefore, in order to monitor the highest concentrations, it is recommended the annual event be conducted in the first three months of 2022.

[6] Additional exceedances of dissolved copper were observed between December 2017 and March 2018. However, the elevated dissolved copper concentrations in porewater and surface water samples collected between December 2017 and March 2018 did not appear to be related to the FPTS or Refinery operations, but were likely associated with contamination resulting from field filtering samples, or to contamination during sample preparation and dilution at the laboratory(AECOM, 2019a). The average concentration calculated for PW17-5 includes only samples collected after March 2018.

Based on inspections of the FPTS, AECOM recommends that additional cobbles and/or boulders are placed over exposures of the geogrid/filter fabric down slope of Sentry Wells on both the Eastern and Western FPTS. Additional boulders should also be replaced around the base of CBP-6. AECOM understands Parkland plans to complete this work in 2021. The current condition of the FPTS is not anticipated to compromise the integrity of the FPTS.

12. STATEMENT OF QUALIFICATIONS AND LIMITATIONS

The attached Report (the "Report") has been prepared by AECOM Canada Ltd. ("AECOM") for the benefit of the Parkland Refining (B.C.) Ltd. (Client) in accordance with the agreement between AECOM and Client, including the scope of work detailed therein (the "Agreement").

The information, data, recommendations and conclusions contained in the Report (collectively, the "Information"):

- is subject to the scope, schedule, and other constraints and limitations in the Agreement and the qualifications contained in the Report (the "Limitations");
- represents AECOM's professional judgement in light of the Limitations and industry standards for the preparation of similar reports;
- may be based on information provided to AECOM which has not been independently verified;
- has not been updated since the date of issuance of the Report and its accuracy is limited to the time period and circumstances in which it was collected, processed, made or issued;
- must be read as a whole and sections thereof should not be read out of such context;
- was prepared for the specific purposes described in the Report and the Agreement; and
- in the case of subsurface, environmental or geotechnical conditions, may be based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time.

AECOM shall be entitled to rely upon the accuracy and completeness of information that was provided to it and has no obligation to update such information. AECOM accepts no responsibility for any events or circumstances that may have occurred since the date on which the Report was prepared and, in the case of subsurface, environmental or geotechnical conditions, is not responsible for any variability in such conditions, geographically or over time.

AECOM agrees that the Report represents its professional judgement as described above and that the Information has been prepared for the specific purpose and use described in the Report and the Agreement, but AECOM makes no other representations, or any guarantees or warranties whatsoever, whether express or implied, with respect to the Report, the Information or any part thereof.

Without in any way limiting the generality of the foregoing, any estimates or opinions regarding probable construction costs or construction schedule provided by AECOM represent AECOM's professional judgement in light of its experience and the knowledge and information available to it at the time of preparation. Since AECOM has no control over market or economic conditions, prices for construction labour, equipment or materials or bidding procedures, AECOM, its directors, officers and employees are not able to, nor do they, make any representations, warranties or guarantees whatsoever, whether express or implied, with respect to such estimates or opinions, or their variance from actual construction costs or schedules, and accept no responsibility for any loss or damage arising therefrom or in any way related thereto. Persons relying on such estimates or opinions do so at their own risk.

Except (1) as agreed to in writing by AECOM and Client; (2) as required by law; or (3) to the extent used by governmental reviewing agencies for the purpose of obtaining permits or approvals, the Report and the Information may be used and relied upon only by Client.

AECOM accepts no responsibility, and denies any liability whatsoever, to parties other than Client who may obtain access to the Report or the Information for any injury, loss or damage suffered by such parties arising from their use of, reliance upon, or decisions or actions based on the Report or any of the Information ("improper use of the Report"), except to the extent those parties have obtained the prior written consent of AECOM to use and rely upon the Report and the Information. Any injury, loss or damages arising from improper use of the Report shall be borne by the party making such use.

This Statement of Qualifications and Limitations is attached to and forms part of the Report and any use of the Report is subject to the terms hereof.

Notes:
1 - Elevations are in Parkland Datum = Geodetic Datum + 91.52 feet.

Abbreviations:
m - metres
m bgs - metres below ground surface
mASL - metres above sea level
mg/L - milligrams per liter
mm - millimetres
ppm - parts per million
--- - no observations

Acronyms:
DTW - depth to water
FPTS - Foreshore Passive Treatment System
NA - not applicable
ND - not detected
TOC - top of casing

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.

1 - Protocol 11 Table 6. Water Upper Cap Concentrations for Schedule 3.2 Substances
2 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.
3 - Laboratory detection limit for xylenes was reduced from 0.75 ug/L to 0.5 ug/L for select samples analyzed in 2021.

BOLD	Sample concentration is detected
SHADE	Sample concentration greater than RBMT
SHADE	Sample Concentration greater than Upper Cap

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres

Acronyms
AG - aquagate
C - Compliance well (Post-construction)
CS - well located cross slope
DL - detection limit
EAZ - ecologically active zone
E FPTS - Eastern Foreshore Passive Treatment System
IBA - In between area
LEPHw - light extractable petroleum hydrocarbons in water
NA - not applicable
GC-MS/FID - Gas Chromotography - Mass Spectrometry / Flame Ionization Detection
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
U - Up gradient well (Post-construction)
VPHw - volatile petroleum hydrocarbons in water
W FPTS - Western Foreshore Passive Treatment System
QA/QC - Quality Assurance / Quality Control
RPD - Relative Percent Difference

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.

1 - Protocol 11 Table 6. Water Upper Cap Concentrations for Schedule 3.2 Substances
2 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.
3 - The Ministry of Environment and Climate Change Strategy (ENV) requires the co-reporting of PAHs when LEPH and HEPH calculations are required, consequently, LEPH and HEPH must be co-reported with the corresponding PAH results. Although these PAHs are not considered site specific contaminants of concern (COCs), they were analyzed to calculate LEPH and/or HEPH and were either not detected or detected below Updated Screening Levels (USLs). For the purpose of this monitoring report, these PAHs have not been tabulated; however, as it is an ENV requirement, the data has been included in the ALS laboratory reports provided in Appendix C.

BOLD	Sample concentration is detected
SHADE	Sample concentration greater than RBMT
SHADE	Sample Concentration greater than Upper Cap

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres
Acronyms
AG - aquagate
C - Compliance well (Post-construction)
EAZ - ecologically active zone
E FPTS - Eastern Foreshore Passive Treatment System
IBA - In between area
NA - not applicable
NS - no standard established for indicated parameter.
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
U - Up gradient well (Post-construction)
W FPTS - Western Foreshore Passive Treatment System

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.
1 - Protocol 11 Table 6. Water Upper Cap Concentrations for Schedule 3.2 Substances
2 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.

BOLD	Sam Sample concentration is detected
SHADE	Sam Sample concentration greater than RBMT
SHADE	Sample Concentration greater than Upper Cap

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres

Acronyms
AG - aquagate
C - Compliance well (Post-construction)
CRC ICPMS - Collision/Reaction Cells Inductively Coupled Plasma Mass Spectrometry
D - dissolved metals
EAZ - ecologically active zone
E FPTS - Eastern Foreshore Passive Treatment System
HR ICPMS - High Resolution Inductively Coupled Plasma Mass Spectrometry
NS - no standard established for indicated parameter.
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
SW - surface water samples
U - Up gradient well (Post-construction)
W FPTS - Western Foreshore Passive Treatment System

BOLD	Sample concentration is detected

Abbreviations
µS/cm - microsiemens per centimetre
g/L - grams per litre
m - metres
mg/L - milligrams per litre
mm - millimetres
NTU - nephelometric turbidity units
ppt - parts per thousand

Acronyms
AG - Aquagate
C - Compliance well
DO - dissolved oxygen
DTW - depth to water
EAZ - ecologically active zone
E FPTS - Eastern Foreshore Passive Treatment System
IBA - In between area
NA - not applicable
NM - not measured
NS - no standard established for indicated parameter
OC - organoclay
ORP - oxidation reduction potential
P - Performance well
PAC - powder activated carbon
S - Sentry well
U - Up gradient well
W FPTS - Western Foreshore Passive Treatment System

FORESHORE POST FPTS CONSTRUCTION
PARKLAND BURNABY REFINERY
FORESHORE 2020 AND 2021 MONITORING REPORT

Date	FPTS	Rip Rap layer maintained at 1.4m	Cobble layer above OBB surface layer maintained at 0.4m	Rip Rap or Cobble replacement Required	Vegetation present above treatment cells or OBB surface layer	Vegetation Removal Required	Damaged Monitoring Wells	Comments
12-Mar-20	Eastern	Yes	Yes	No	Small woody shrubs and blackberry growing along southern edge; no vegetation growth on treatment cells; some vines hanging over southern edge of riprap	Hand pulled small shrubs and trimmed vines; pulled around 25 plants; no vegetation of concern left	No	No major damage; chipping of CBP-5 and PW17-30; moderate barnacle growth on most wells. Geogrid and filter fabric exposed in ten areas (six on the Eastern FPTS and four on the Western FPTS) along the contact point between the rip rap and cobble interface. TP1: Sand from 0 - 0.13mbgs; Cobble from 0.13 - 0.42mbgs; No liner encountered TP2: Sand from 0 - 0.17mbgs; Cobble from 0.17 - 0.39 mbgs; No liner encountered TP3: Cobble from 0 - 0.38mbgs; Liner encountered
	Western	Yes	Yes	No	Growth of small weeds overtop of treatment cells; no vegetation growth of concern on northern side; vegetation branches and vines hanging over riprap barrier	Hand pulled around 10 small vegetation; no vegetation of concern left	No	
22-Jun-20	Eastern	Yes	Yes	No	Numerous 1m tall weeds growing on top of the barrier around the upgradient wells; no vegetation on top of treatment cells or OBB layer; Overhanging vegetation on southern side of the barrier are present	Hand pulled numerous weeds	No	Wells submerged at high tide have barnacle and seaweed growth on the outer casing; most wells have received minor chipping of the protective casing. Geogrid and filter fabric exposed in ten areas (six on the Eastern FPTS and four on the Western FPTS) along the contact point between the rip rap and cobble interface. TP1: Sand from 0 - 0.13mbgs; Cobble from 0.13 - 0.42mbgs; No liner encountered TP2: Sand from 0 - 0.04mbgs; Cobble from 0.04 - 0.48 mbgs; Liner encountered TP3: Cobble from 0 - 0.52mbgs; Liner encountered
	Western	Yes	Yes	No	A couple of 1m tall weeds growing on top of the barrier around the upgradient wells; no vegetation was observed on top of the treatment cells or the OBB layer; Overhanging vegetation on the southern side of the barrier are present	Hand pulled numerous weeds	No	
28-Sep-20	Eastern	Yes	Yes	No	1m of vegetation growth overhanging the barrier on the southern side; growth of small weeds overtop of treatment cells are present; pose no risk to cell integrity; no indication of vegetation growing through installed liner	Hand pulled numerous small weeds. Overhanging vegetation on the south side of the barrier should be monitored; potential removal planned in the future.	No	No major damage; all wells have barnacles and seaweed growth on the outer surface of the protective casing; minor chipping is present on the protective casing as well. Geogrid and filter fabric exposed in ten areas (six on the Eastern FPTS and four on the Western FPTS) along the contact point between the rip rap and cobble interface. TP1: Sand from 0 - 0.14mbgs; Cobble from 0.14 - 0.52mbgs; Liner encountered TP2: Sand from 0 - 0.02mbgs; Cobble from 0.02 - 0.52 mbgs; Liner encountered TP3: Cobble from 0 - 0.52mbgs; Liner encountered
	Western	Yes	Yes	No	1m of vegetation growth overhanging the barrier on the southern side; growth of small weeds overtop of treatment cells are present; pose no risk to cell integrity; no indication of vegetation growing through installed liner	Hand pulled numerous small weeds. Overhanging vegetation on the south side of the barrier should be monitored; potential removal planned in the future.	No

FORESHORE POST FPTS CONSTRUCTION
PARKLAND BURNABY REFINERY
FORESHORE 2020 AND 2021 MONITORING REPORT

Date	FPTS	Rip Rap layer maintained at 1.4m	Cobble layer above OBB surface layer maintained at 0.4m	Rip Rap or Cobble replacement Required	Vegetation present above treatment cells or OBB surface layer	Vegetation Removal Required	Damaged Monitoring Wells	Comments
08-Dec-20	Eastern	Yes	Yes	No	1m of vegetation growth overhanging the barrier on the southern side; growth of small weeds overtop of treatment cells are present; pose no risk to cell integrity; no indication of vegetation growing through installed liner	No vegetation was removed	No	No major damage; all wells have barnacles and seaweed growth on the outer surface of the protective casing; concrete base of CBP-6 is no longer completely covered with riprap; minor chipping is present on the protective casing as well Geogrid and filter fabric exposed in ten areas (six on the Eastern FPTS and four on the Western FPTS) along the contact point between the rip rap and cobble interface. TP1: Sand from 0 - 0.08mbgs; Cobble from 0.08 - 0.42mbgs; Liner encountered TP2: Sand from 0 - 0.10mbgs; Cobble from 0.10 - 0.45 mbgs; Liner encountered TP3: Cobble from 0 - 0.53mbgs; Liner encountered
	Western	Yes	Yes	No	1m of vegetation growth overhanging the barrier on the southern side; growth of small weeds overtop of treatment cells are present; pose no risk to cell integrity; no indication of vegetation growing through installed liner	No vegetation was removed	No	
03-Mar-21	Eastern	Yes	Yes	No	No growth above treatment cells or OBB surface layer. Vegetation growth along Up Gradient wells as well as overhanging on southern edge of the barrier.	No. Hand pulled some weeds. Overhanging vegetation on the south side of the barrier should be monitored; potential removal planned in the future.	No	No major damage; all wells have barnacles and seaweed growth on the outer surface of the protective casing; minor chipping is present on the protective casing as well; J-plug replace on PW17-7. Geogrid and filter fabric exposed in ten areas (six on the Eastern FPTS and four on the Western FPTS) along the contact point between the rip rap and cobble interface. TP1: Sand from 0 - 0.03 mbgs; Cobble from 0.03 - 0.40 mbgs; Liner encountered. TP2: Sand from 0 - 0.02; Cobble from 0.02 - 0.46 mbgs; Liner encountered. TP3: Cobble from 0- 0.63 m bgs; Liner not encountered.
	Western	Yes	Yes	No	No growth above treatment cells or OBB surface layer. Vegetation growth along Up Gradient wells as well as overhanging on southern edge of barrier.	No. Hand pulled some weeds. Overhanging vegetation on the south side of the barrier should be monitored; potential removal planned in the future.	No	

Abbreviations:

FPTS - Foreshore Passive Treatment System
NM - Not monitored
OBB - Oleophilic biobarrier
NA - Not applicable
m bgs - metres below grround surface

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.

1 - Protocol 11 Table 6. Water Upper Cap Concentrations for Schedule 3.2 Substances
2 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.
3 - Analysis was performed on each bottle submitted for the desired parameter instead of on the submitted bottles collectively.

BOLD	Sample concentration is detected
SHADE	Sample concentration greater than RBMT
SHADE	Sample Concentration greater than Upper Cap

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres

Acronyms
AG - aquagate
C - Compliance well (Post-construction)
DL - detection limit
E FPTS - Eastern Foreshore Passive Treatment System
GC-MS/FID - Gas Chromotography - Mass Spectrometry / Flame Ionization Detection
IBA - In between area
LEPHw - light extractable petroleum hydrocarbons in water
NA - not applicable
NBO - near bottom samples
NS - no standard established for indicated parameter
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
SW - surface water samples
U - Up gradient well (Post-construction)
VPHw - volatile petroleum hydrocarbons in water
W FPTS - Western Foreshore Passive Treatment System

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.
1 - BCMoE (British Columbia Ministry of Environment) groundwater standard is for LEPH corrected for polycyclic aromatic hydrocarbons (PAHs); EPHw(C10-<C19) 1 is LEPH uncorrected for PAHs and therefore conservative.
2 - HEPH USL removed per the BCMoE letter from June 21, 2013

3 - The rational supporting the Updated Screening Levels (USLs) for porewater and surface water is provided by SLR Consulting Canada Ltd. in their memorandum entitled Updated Screening Levels for Foreshore Monitoring including an Addendum, dated May 9 and June 6, 2013, respectively. A general hierarchy was developed for defining USLs as follows: First) BC Water Quality Guidelines (approved then working); Second) 1/10 CSR aquatic life marine standards (for porewater); and lastly, reference area concentration (which commonly defaults to the laboratory detection limit)
4 - Sample IDs do not exactly match laboratory reports. They have been cleaned up for easy comparison of same location over time.
5 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.

BOLD	Sample concentration is detected
SHADE	Sample concentration greater than Updated Screening Level
SHADE	Sample concentration greater than Updated Screening Level and/or RBMT

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres
Acronyms
AG - Aquagate
ATB- well located in anchor trench barrier
BC AWQG - British Columbia Approved Water Quality Guidelines. Marine unless otherwise noted as FW (freshwater).
C - Compliance well (Post-construction)
CL - culvert location
CS - well located cross slope
CSR/10 - Contaminated Sites Regulation (including up to Stage 11 amendments, November 2017) divided by ten (10)
DL - detection limit
DS - well located down slope
EAZ - ecologically active zone
EB - eastern barrier
E FPTS - Eastern Foreshore Passive Treatment System
EPHw - extractable petroleum hydrocarbons in water
HEPHw - heavy extractable petroleum hydrocarbons in water
IBA - In between area
LEPHw - light extractable petroleum hydrocarbons in water
NA - not applicable
NBO - near bottom samples
NS - no standard established for indicated parameter
OB - well located within the original barrier
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
SW - surface water samples
U - Up gradient well (Post-construction)
USAT - well located up slope of anchor trench
VHw - volatile hydrocarbons in water
VPHw - volatile petroleum hydrocarbons in water
W FPTS - Western Foreshore Passive Treatment System

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.

1 - Protocol 11 Table 6. Water Upper Cap Concentrations for Schedule 3.2 Substances
2 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their
3 -The Ministry of Environment and Climate Change Strategy (ENV) requires the co-reporting of PAHs when LEPH and HEPH calculations are required, consequently, LEPH and HEPH must be co-reported with the corresponding PAH results. Although these PAHs are not considered site specific contaminants of concern (COCs), they were analyzed to calculate LEPH and/or HEPH and were either not detected or detected below Updated Screening Levels (USLs). For the purpose of this monitoring report, these PAHs have not been tabulated; however, as it is an ENV requirement, the data has been included in the ALS laboratory reports provided in Appendix C.

BOLD	Sample concentration is detected
SHADE	Sample concentration greater than RBMT
SHADE	Sample Concentration greater than Upper Cap

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres

Acronyms
AG - aquagate
C - Compliance well (Post-construction)
E FPTS - Eastern Foreshore Passive Treatment System
IBA - In between area
NA - not applicable
NBO - near bottom samples
NS - no standard established for indicated parameter.
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
SW - surface water samples
U - Up gradient well (Post-construction)
W FPTS - Western Foreshore Passive Treatment System

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.
1 - The rational supporting the Updated Screening Levels (USLs) for porewater and surface water is provided by SLR Consulting Canada Ltd. in their memorandum entitled Updated Screening Levels for Foreshore Monitoring including an Addendum, dated May 9 and June 6, 2013, respectively. A general hierarchy was developed for defining USLs as follows: First) BC Water Quality Guidelines (approved then working); Second) 1/10 CSR aquatic life marine standards (for porewater); and lastly, reference area concentration (which commonly defaults to the laboratory detection limit)
2 - This is a derived value and not a BCAWQG. See Memorandum "Updated Screening Levels For Foreshore Monitoring", April 25, 2013 for how the value was derived.
3 - Sample IDs do not exactly match laboratory reports. They have been cleaned up for easy comparison of same location over time.
4 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.
5 - The laboratory detection limit for pyrene (0.05 µg/L) exceeds the surface water USL for pyrene of 0.02 µg/L
6 - The Ministry of Environment and Climate Change Strategy (ENV) requires the co-reporting of PAHs when LEPH and HEPH calculations are required, consequently, LEPH and HEPH must be co-reported with the corresponding PAH results. Although these PAHs are not considered site specific potential contaminants of concern (PCOCs), they were analyzed to calculate LEPH and/or HEPH and were either not detected or detected below Updated Screening Levels (USLs). For the purpose of this monitoring report, these PAHs have not been tabulated; however, as it is an ENV requirement, the data has been included in the ALS laboratory reports provided in Appendix E.

BOLD	Sample concentration is detected
SHADE	Sample concentration greater than Updated Screening Level
SHADE	Sample concentration greater than Updated Screening Level and/or RBMT

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres

Acronyms
AG - Aquagate
ATB - well located in anchor trench barrier
BC - British Columbia Ministry of Environment Reference Method
BC AWQG - British Columbia Approved Water Quality Guidelines. Marine unless otherwise noted as FW (freshwater).
C - Compliance well (Post-construction)
CS - well located cross slope
CSR/10 - Contaminated Sites Regulation (including up to Stage 11 amendments, November 2017) divided by ten (10)
DS - well located down slope
EAZ - ecologically active zone
EB - eastern barrier
E FPTS - Eastern Foreshore Passive Treatment System
FIGQG -Federal Interim Groundwater Quality Guidelines
IBA - In between area
NA - not applicable
NBO - near bottom samples
NS - no standard established for indicated parameter
OB - well located within the original barrier
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
PAH - polycyclic aromatic hydrocarbons
RBMT - risk based management target
S - Sentry well (Post-construction)
SW - surface water samples
U - Up gradient well (Post-construction)
USAT - well located up slope of anchor trench
WB - western barrier
W FPTS - Western Foreshore Passive Treatment System

Notes
< - Sample concentration less than the detection limit indicated.
--- - Sample not analyzed for indicated parameter.
@ - AECOM considers the December 2017 porewater and surface water dissolved copper data as suspect.
# - Deionized water filter assessment samples.
1 - Protocol 11 Table 6. Water Upper Cap Concentrations for Schedule 3.2 Substances
2 - On February 28, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps which was accepted by the MoE in their letter dated August 28, 2014.

BOLD	Sam Sample concentration is detected
SHADE	Sam Sample concentration greater than RBMT
SHADE	Sample Concentration greater than Upper Cap

Abbreviations
µg/L [ppb] - micrograms/litre [parts per billion]
m - metres

Acronyms
AG - aquagate
C - Compliance well (Post-construction)
CRC ICPMS - Collision/Reaction Cells Inductively Coupled Plasma Mass Spectrometry
D - dissolved metals
EAZ - ecologically active zone
E FPTS - Eastern Foreshore Passive Treatment System
HR ICPMS - High Resolution Inductively Coupled Plasma Mass Spectrometry
NBO - near bottom samples
NS - no standard established for indicated parameter.
OC - organoclay
P - Performance well (Post-construction)
PAC - powder activated carbon
RBMT - risk based management target
S - Sentry well (Post-construction)
SW - surface water samples
T - total metals
U - Up gradient well (Post-construction)
W FPTS - Western Foreshore Passive Treatment System

Appendix B

Regulatory Context

Regulatory Context

Several provincial and federal regulatory agencies share authority for assessing and managing contaminated sites in British Columbia (BC). The agencies that have regulatory power include Fisheries and Oceans Canada (DFO), Environment Canada (EC), and the BC Ministry of Environment and Climate Change Strategy (ENV). The Parkland Burnaby Refinery is a tenant of the Port of Vancouver (POV), and is, therefore, also under the jurisdiction of the POV. POV operates under the *Canada Marine Act* and is a responsible agency under the *Canadian Environmental Assessment Act*. The BC ENV has taken the lead role in reviewing the remediation of the contamination at the Foreshore Site.

Federal statutes and regulations that apply to the Foreshore area marine sediment include:

- Canadian Environmental Protection Act, 1999 (S.C. 1999, c.33) and associated regulations;
- Canada Marine Act, 1998 (S.C. 1998, c.10) and associated regulations; and,
- Fisheries Act (R.S.C. 1985, c. F-14) and associated regulations.

Provincial statues and regulations that apply to the management of soil, groundwater, sediment and porewater quality include:

- BC Environmental Management Act (EMA) (S.B.C. 2003, c 53), effective July 8, 2004;
- Contaminates Sites Regulation (CSR), BC Reg. 375/96, effective April 1, 1997 (including Stage 13 amendments, February 1, 2021); and
- Hazardous Waste Regulation (HWR), BC Reg. 63/88, effective April 1, 1988 (including amendments up to B.C. Reg. 243/2016).

For surface water and porewater below the high-water mark, the BC ENV Approved and Working Water Quality Guidelines (WQG) for marine aquatic life apply.

CANADIAN ENVIRONMENTAL ASSESSMENT ACT

Section 67 of the *Canadian Environmental Assessment Act, 2012* requires federal authorities to determine that projects will not likely cause significant adverse environmental effects (or, if a project is likely to cause significant adverse environmental effects, requires the Governor in Council to decide whether those effects are justified in the circumstances). The Project and Environmental Review (PER) process provides that assurance. The Port Authority also considers other interests, impacts, and mitigation measures through the PER process.

CANADIAN ENVIRONMENTAL PROTECTION ACT

Within the federal government, the *Canadian Environmental Protection Act (CEPA)* is the primary element of the legislative framework for preventing pollution and protecting the environment and human health. In general, CEPA:

- Makes pollution prevention the cornerstone of national efforts to reduce toxic substances in the environment;
- Sets out processes to assess the risks to the environment and human health posed by substances in commerce (in use) or used for manufacturing purposes in Canada;
- Imposes time frames for managing toxic substances;
- Provides a wide range of tools to manage toxic substances, other pollution and wastes; and
- Ensures the most harmful substances are phased out or not released into the environment in any measurable quantity.

CANADIAN MARINE ACT

- The *Canada Marine Act (CMA)* created Canadian Port Authorities. The CMA allows POV, under the Port Authorities Operations Regulations, to provide authorization to complete works within its jurisdiction. The Foreshore Site is located within the jurisdiction of POV.

FISHERIES ACT

Under the authority of the *Fisheries Act*, DFO has decision-making authority for the conservation and protection of fish and fish habitat. The fish and fish habitat protection provisions of the Fisheries Act provide mechanisms to allow development of projects to occur while providing for the protection of fish and fish habitat.

The key sections within the act that directly apply to this project are:

- Section 35(1) of the Fisheries Act which prohibits the harmful alteration, disruption or destruction of fish habitat; and
- Section 36(3) of the Fisheries Act which prohibits the discharge of deleterious substances to water frequented by fish either directly or indirectly.

CONTAMINATED SITES REGULATION

The CSR under the EMA is the principal regulatory document defining requirements for contaminated sites management in BC. The CSR came into effect on April 1, 1997; thirteen amendments to the CSR have been completed since 1997, with the most recent being the Stage 13, which came into effect on February 1, 2021. The EMA and CSR have provisions for both the numerical standards and risk-based standards approaches to managing site contamination. They outline the procedures for site assessment, remediation and application for environmental closure for a property. Numerical standards are key components of the requirements in the CSR as they define whether or not a site is contaminated. Land Remediation staff of the ENV currently oversee the ongoing investigation and remediation.

Under the CSR, there are three types of numerical remediation standards. 1) The Generic Numerical Standards refer to concentrations of given substances in soil or water for a particular land use. 2) Matrix Numerical Standards are applied for some substances in soil, taking into account various site-specific factors such as proximity to receiving waters, likelihood of human ingestion, and use of land for livestock rearing. 3) Site-Specific Numerical Standards involve the generation of a standard for a specific site, based on a protocol outlined by BC ENV (Protocol 2).

The CSR is simplified into four new schedules:

- Schedule 3.1 – Part 1, Matrix Numerical Soil Standards;
- Schedule 3.1 – Part 2, Generic Numerical Soil Standards to Protect Human Health;
- Schedule 3.1 – Part 3, Generic Numerical Soil Standards to Protect Ecological Health;
- Schedule 3.2, Generic Numerical Water Standards;
- Schedule 3.3, Generic Numerical Vapour Standards; and
- Schedule 3.4, Generic Numerical Sediment Standards.

BC CSR PROTOCOL 11 UPPER CAP CONCENTRATIONS

This protocol sets the upper cap concentrations for substances with numerical standards in the CSR and which, when present in the exposure zone of soil, water, sediment or vapour, could pose high risks to the environment or human health. If upper cap concentrations are exceeded, an analysis of exposure pathways, under Protocol 12, usually must be carried out to determine if a site is classified as high risk.

APPLICABLE SCREENING LEVELS FOR WATER

GROUNDWATER

In accordance with BC CSR Protocol 21, standards for the protection of drinking water are applicable at sites either where groundwater is currently used as a drinking water source (current use) or could be used as a drinking water source (future use).

Current drinking water use is applicable at sites where drinking water wells or surface water intakes are present within a radial distance of 500 m from the outer extent of the groundwater contamination source. If the groundwater flow direction is reliably known, the distance is refined to drinking water wells or surface water intakes located 100 metres upgradient and 500 metres downgradient of the outer extent of the contamination source.

Future drinking water use is applicable at sites where the hydraulic conductivity is greater than 1×10^{-6} metres per second (m/s), has a yield greater than or equal to 1.3 litres per minute and where the natural concentration of total dissolved solids is less than 4,000 milligrams per litre (mg/L). Future drinking water use is applicable at sites where a saturated unit exists at depth that meets the above criteria and does not have a protective five metre thick confining unit with a bulk hydraulic conductivity less than 1×10^{-7} m/s that is continuous and unfractured[7]. Saturated geological units that are located within 500 metres of a marine and estuarine foreshore are considered to have unsuitable water quality for domestic water supply. In accordance with BC CSR Protocol 21, future drinking water use does not apply to the Foreshore Site.

The Foreshore Site is located on the foreshore of Burrard Inlet, in the north part of Burnaby where all properties are connected to the municipal potable water supply. There are no known drinking water wells in the vicinity of the Foreshore Site; therefore, there is no current drinking water use at, or in the vicinity of the Foreshore Site.

A letter requesting a drinking water standards exemption for Area 2 of the Refinery, located up-gradient of the Foreshore Site, was submitted to the British Columbia Ministry of Environment and Climate Change Strategy on December 19, 2011 and re-submitted on November 9, 2012. The drinking water exemption was provided by the BC ENV on May 15, 2017.

Standards for aquatic life water use apply to all groundwater located within 500 m of a surface water body containing aquatic life unless groundwater at the Foreshore Site flows to another surface water body located greater than 500 m from the source. Standards for aquatic life water use also apply where there is the potential for contaminated groundwater to flow through preferential corridors that discharge directly to a surface water body containing marine or freshwater aquatic life.

POREWATER

The MoE's January 24, 2011 letter outlined the previous screening standards applied to the Foreshore Site for porewater regardless of the depth (BC WQG or where they do not exist, 1/10 of the Schedule 6 CSR aquatic life [AW] Marine standard – see below for further details). For simplicity, surface water screening followed the same procedure as porewater.

Since surface water and porewater sampling locations are at the Foreshore Site (within 10 m of the high-water mark), the water screening cannot assume the dilution factor used in the development of CSR groundwater standards. Concentrations of potential contaminants of concern (PCOCs) reported in surface water and porewater samples are currently screened against Ambient BC WQG for marine waters. For PCOCs where BC WQG do not exist, 1/10 of the Schedule 6 CSR AW Marine standards were used for screening purposes. For contaminants with no BC WQG or 1/10 CSR AW standard, a reference site approach was used with background concentrations used for screening as described in Protocol 9. The Reference Area for water samples was the PR2 sampling location (Figure 1). If the background concentrations did not fall within a single statistical population, conservative estimates were used. The reference water concentrations for many PCOCs are below their respective standard laboratory reporting limit. In these cases, the laboratory reporting limit from the reference locations was considered the reference standard and used for this screening. An exception in using the 1/10 of the CSR AW standard

[7] BC Ministry of Environment, 2010. Technical Guidance 6. Water Use Determination. Victoria, BC. http://www.env.gov.bc.ca/epd/remediation/guidance/technical/pdf/tg06.pd

as the reference concentration is for $LEPH_w$. Since $LEPH_w$ does not have BC WQG standard and the common laboratory reporting limit is five times greater than 1/10 CSR AW standard, the reference location laboratory detection limit was used for $LEPH_w$ screening.

SITE SPECIFIC STANDARDS

In their memorandum dated May 9, 2013, SLR Consulting Canada Ltd. (SLR) proposed harmonizing the two sets of screening levels, i.e. those standards previously described in this section and the screening levels proposed by SLR in the problem formulation report (SLR, 2011). The rationale supporting the updated screening levels is provided by SLR in their memorandum entitled *Updated Screening Levels (USLs) for Foreshore Monitoring* including an addendum included as an appendix within the Foreshore 2012 Second Semi-Annual Report (URS, 2013). The USLs were deemed satisfactory by the MoE in email correspondence to SLR on September 4, 2013 (MoE, 2013). The porewater and surface water samples in this report were screened against the updated SLR screening levels with the exception of HEPHw.

The MoE's June 21, 2013 letter indicated that HEPHw is not a regulated parameter under the CSR and is, therefore, not normally characterized or otherwise assessed for the regulatory purposes of the CSR in groundwater or porewater. Therefore, porewater and surface water samples in this report were not screened against a standard for HEPHw.

On February 27, 2014, SLR submitted a Human Health and Ecological Risk Assessment (HHERA) to determine Risk-Based Management Targets (RBMTs) for PCOCs associated with the Foreshore seeps. The RBMTs were developed to be protective of aquatic plants and invertebrates at the community level and fish at the population level. The HHERA did not find any significant risk to human health; therefore, RBMTs were not needed for human receptors. In the HHERA, SLR derived RBMTs for the following PHCs and PAHs: BTEX, benzo(a)pyrene, naphthalene, VPH_w, and $LEPH_w$. In the HHERA, SLR derived RBMTs for only two metals, copper and zinc, which were identified as porewater PCOCs for the Foreshore Site (SLR, 2014b).

Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*
SUR-ND	*Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21A3930**	Page	: 1 of 17
Amendment	: 1		
Client	: **AECOM Canada Ltd.**	Laboratory	: Vancouver - Environmental
Contact	: Leslie Southern	Account Manager	: Dean Watt
Address	: 3292 Production Way Burnaby BC Canada V5A 4R4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 60653584/15405	Date Samples Received	: 03-Mar-2021 19:15
PO	: 4222178	Issue Date	: 16-Mar-2021 12:52
C-O-C number	: ----		
Sampler	: CXW/AAR/DB		
Site	: Burnaby Refinery		
Quote number	: AECOM		
No. of samples received	: 25		
No. of samples analysed	: 25		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Test sample Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Regular Sample Surrogates

Sub-Matrix: **Pore Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Result	Limits	Comment
Samples Submitted							
Hydrocarbons Surrogates	VA21A3930-014	PW17-20_20210303|REG|GW	dichlorotoluene, 3,4-	97-75-0	63.1 %	70.0-130 %	Recovery less than lower data quality objective

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Seawater by CRC ICPMS (HMI)	E469S Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS (HMI Mode).
VH and F1 by Headspace GC-FID	E581.VH+F1 Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as $CaCO_3$), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
VPH: VH-BTEX-Styrene	EC580A Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
VOCs Preparation for Headspace Analysis	EP581 Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

CERTIFICATE OF ANALYSIS

Work Order	: **VA21A4107**	Page	: 1 of 10
Client	: **AECOM Canada Ltd.**	Laboratory	: Vancouver - Environmental
Contact	: Leslie Southern	Account Manager	: Dean Watt
Address	: 3292 Production Way Burnaby BC Canada V5A 4R4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: (604) 444-6400	Telephone	: +1 604 253 4188
Project	: 60653584/15405	Date Samples Received	: 04-Mar-2021 18:25
PO	: 4222178	Date Analysis Commenced	: 05-Mar-2021
C-O-C number	: ----	Issue Date	: 16-Mar-2021 13:26
Sampler	: AAR, CXW, DB, JVB		
Site	: Burnaby Refinery		
Quote number	: AECOM		
No. of samples received	: 18		
No. of samples analysed	: 18		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Extractions	Organics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Paul Cushing	Team Leader - Organics	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21A4107**	Page	: 1 of 15
Client	: **AECOM Canada Ltd.**	Laboratory	: Vancouver - Environmental
Contact	: Leslie Southern	Account Manager	: Dean Watt
Address	: 3292 Production Way Burnaby BC Canada V5A 4R4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 60653584/15405	Date Samples Received	: 04-Mar-2021 18:25
PO	: 4222178	Issue Date	: 16-Mar-2021 13:26
C-O-C number	: ----		
Sampler	: AAR, CXW, DB, JVB		
Site	: Burnaby Refinery		
Quote number	: AECOM		
No. of samples received	: 18		
No. of samples analysed	: 18		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Seawater by CRC ICPMS (HMI)	E469S Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS (HMI Mode).
VH and F1 by Headspace GC-FID	E581.VH+F1 Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as $CaCO_3$), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
VPH: VH-BTEX-Styrene	EC580A Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
VOCs Preparation for Headspace Analysis	EP581 Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

					Matrix Spike (MS) Report					
					Spike		Recovery (%)	Recovery Limits (%)

Tumaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply

☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum

☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum

☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum

☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum

☐ Same day [E2] if received by 10am M-S - 200% rush surcharge. Additional fees may apply to rush requests on weekends, statutory holidays and non-routine tests

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

Report To	Contact and company name below will appear on the final report
Company:	AECOM Canada Ltd.
Contact:	Leslie Southern
Phone:	604-444-6608
	Company address below will appear on the final report
Street:	3292 Production Way
City/Province:	Burnaby, BC
Postal Code:	V5A 4R4
Invoice To	Same as Report To ☐ YES ☑ NO
	Copy of Invoice with Report ☐ YES ☑ NO
Company:	Parkland Refinery (B.C.) Ltd.
Contact:	Christopher Boys

Reports / Recipients

Select Report Format: ☑ PDF ☑ EXCEL ☑ EDD (DIGITAL)

Merge QC/QCI Reports with COA ☑ YES ☐ NO ☐ N/A

☑ Compare Results to Criteria on Report - provide details below if box checked

Select Distribution: ☑ EMAIL ☐ MAIL ☐ FAX

Email 1 or Fax: leslie.southern@aecom.com

Email 2: justin.becker@aecom.com

Email 3: aaron.rysdale@aecom.com

Invoice Recipients

Select Invoice Distribution: ☑ EMAIL ☐ MAIL ☐ FAX

Email 1 or Fax: christopher.boys@parkland.ca

Email 2: leslie.southern@aecom.com

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply

☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum

☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum

☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum

☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum

☐ Same day [E2] If received by 10am M-S - 200% rush surcharge. Additional fees may apply to rush requests on weekends, statutory holidays and non-routine tests

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

CERTIFICATE OF ANALYSIS

Work Order	: **VA20C2850**	Page	: 1 of 6
Client	: **AECOM Canada Ltd.**	Laboratory	: Vancouver - Environmental
Contact	: Stephen Sumsion	Account Manager	: Dean Watt
Address	: 3292 Production Way Burnaby BC Canada V5A 4R4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: (604) 444-6400	Telephone	: +1 604 253 4188
Project	: 60628556/15405	Date Samples Received	: 08-Dec-2020 23:05
PO	: 4222178	Date Analysis Commenced	: 09-Dec-2020
C-O-C number	: 17-864639	Issue Date	: 17-Dec-2020 17:33
Sampler	: CXW + ARR		
Site	: ----		
Quote number	: AECOM		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Harsha Attanayake	Laboratory Analyst	Organics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
SUR-ND	*Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.*

No. of samples received	: 11		
No. of samples analysed	: 11		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Test sample Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Seawater by CRC ICPMS (HMI)	E469S Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS (HMI Mode).
VH and F1 by Headspace GC-FID	E581.VH+F1 Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
VPH: VH-BTEX-Styrene	EC580A Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
VOCs Preparation for Headspace Analysis	EP581 Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Omar Beydoun	Lab Assistant	Metals, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA20C3039**	Page	: 1 of 15
Client	: **AECOM Canada Ltd.**	Laboratory	: Vancouver - Environmental
Contact	: Stephen Sumsion	Account Manager	: Dean Watt
Address	: 3292 Production Way Burnaby BC Canada V5A 4R4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 60628556/15405	Date Samples Received	: 09-Dec-2020 23:35
PO	: 4222178	Issue Date	: 17-Dec-2020 17:36
C-O-C number	: 17-864639 (times 2)		
Sampler	: RMC + CXW		
Site	: ----		
Quote number	: AECOM		
No. of samples received	: 18		
No. of samples analysed	: 18		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Seawater by CRC ICPMS (HMI)	E469S Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS (HMI Mode).
VH and F1 by Headspace GC-FID	E581.VH+F1 Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as $CaCO_3$), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
VPH: VH-BTEX-Styrene	EC580A Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
VOCs Preparation for Headspace Analysis	EP581 Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

QUALITY CONTROL REPORT

No. of samples analysed	: 18		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia

Omar Beydoun	Lab Assistant	Metals, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples received	: 13		
No. of samples analysed	: 13		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Brieanna Allen	Department Manager - Organics	Organics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µg/L	micrograms per litre
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
RRV	*Reported result verified by repeat analysis.*
SUR-ND	*Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA20C3128**	Page	: 1 of 14
Client	: **AECOM Canada Ltd.**	Laboratory	: Vancouver - Environmental
Contact	: Stephen Sumsion	Account Manager	: Dean Watt
Address	: 3292 Production Way Burnaby BC Canada V5A 4R4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 60628556/15405	Date Samples Received	: 10-Dec-2020 23:42
PO	: 4222178	Issue Date	: 18-Dec-2020 16:48
C-O-C number	: 17-864639		
Sampler	: ARR + CXW		
Site	:		
Quote number	: AECOM		
No. of samples received	: 13		
No. of samples analysed	: 13		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Test sample Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Regular Sample Surrogates

Sub-Matrix: **Pore Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Result	Limits	Comment
Samples Submitted							
Hydrocarbons Surrogates	VA20C3128-007	PW17-9_20201210|REG|GW Brackish Water	dichlorotoluene, 3,4-	97-75-0	65.0 %	70.0-130 %	Recovery less than lower data quality objective

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Seawater by CRC ICPMS (HMI)	E469S Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS (HMI Mode).
VH and F1 by Headspace GC-FID	E581.VH+F1 Vancouver - Environmental	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
BC PHC - EPH by GC-FID	E601A Vancouver - Environmental	Water	BC MOE Lab Manual	Extractable Petroleum Hydrocarbons (EPH) are analyzed by GC-FID.
BTEX by Headspace GC-MS	E611A Vancouver - Environmental	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hexane LVI GC-MS	E641A Vancouver - Environmental	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as $CaCO_3$), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
VPH: VH-BTEX-Styrene	EC580A Vancouver - Environmental	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A Vancouver - Environmental	Water	BC MOE Lab Manual (LEPH and HEPH) (mod)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
VOCs Preparation for Headspace Analysis	EP581 Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 Vancouver - Environmental	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Select Service Level Below - Contact your AM to confirm all E&P TATs (surcharges may apply)

Regular [R] ☒ Standard TAT if received by 3 pm - business days - no surcharges apply

PRIORITY (Business Days): 4 day [P4-20%] ☐; 3 day [P3-25%] ☐; 2 day [P2-50%] ☐

EMERGENCY: 1 Business day [E - 100%] ☐; Same Day, Weekend or Statutory holiday [E2 -200% (Laboratory opening fees may apply)] ☐

Date and Time Required for all E&P TATs: _____ dd-mmm-yy hh:mm

For tests that can not be performed according to the service level selected, you will be contacted.

Quality Assurance and Quality Control Protocols

DATA QUALITY ASSURANCE/QUALITY CONTROL

In order to assure the integrity and defensibility of the data collected, rigorous QA/QC protocols were observed. These protocols ensured that all samples were properly collected, identified, stored, shipped, and documented. Standard operating procedures (SOPs) for sample collection and storage, equipment decontamination, and sample chain of custody protocols were followed. Porewater samples were collected using sampling techniques discussed above. The use of these methods ensured the quality, soundness, and defensibility of the data obtained. The laboratory analytical data, once generated, was also proofed for inconsistencies and anomalies. Field duplicates, trip blanks, and rinsate blanks were collected for QA/QC purposes.

Field Duplicate Samples

Field duplicate samples are two identical samples that are submitted to the laboratory with no indication that they are the same. The analysis of field duplicate samples provides an indication of the total precision of the sampling and analysis process. Field duplicate samples were collected and analyzed at a rate of approximately 10% of samples for a given analytical suite.

Trip Blanks

Trip blanks are samples of clean deionized, distilled (Reagent Grade Type II) water that are prepared in the laboratory, taken to the field, retained on site throughout sample collection, returned to the laboratory, and analyzed with the environmental samples. The QA/QC review identifies trip blanks with detections of target analytes and evaluates the effect of the detections on associated sample results for possible cross-contamination during transport. One trip blank was included for analysis in every cooler submitted to the laboratory.

Rinsate Blanks

Rinsate blanks are samples of deionized and distilled analyte free (Reagent Grade Type II) water that are prepared in the field by pouring water over or through decontaminated field sampling equipment[8], prior to the collection of the environmental samples. The QA/QC review identifies rinsate blank detections of target analytes and evaluates the effect of the detections on associated sample results for possible cross-contamination during sample collection. Rinsate blank samples were collected and analyzed at a rate of approximately 5% of samples for petroleum hydrocarbon parameters (BTEX, VPH_w, and $LEPH_w$).

Precision

Precision measures the reproducibility of repetitive measurements and is usually expressed in terms of imprecision. It is strictly defined as the degree of mutual agreement among multiple independent measurements as the result of repeated application of the same process under similar conditions.

Analytical precision is a measurement of the variability associated with the duplicate (*i.e.,* two) or replicate (*i.e.,* more than two) analyses of the same sample in the laboratory, and is determined by the analysis of matrix spike duplicate or laboratory duplicate samples.

Total precision is a measurement of the variability associated with the entire sampling and analysis process. It is determined by the analysis of duplicate or replicate field samples and incorporates any variability introduced by the analytical procedure, sample collection and handling procedures, and matrix factors. Precision data must be interpreted by taking into consideration these possible sources of variability.

Duplicate field samples were collected, and duplicate spiked or unspiked samples were analyzed to assess analytical precision. The results were assessed using the relative percent difference (RPD) between duplicate measurements. The equation used to calculate RPD for duplicate samples is:

[8] Throughout the 2020 and 2021 sampling programs, the decontaminated equipment used for the collection of the rinsate blanks included the oil/water interface meter.

$$RPD = \frac{(A - B)}{((A + B)/2)} \times 100$$

where:

A	=	analytical result
B	=	duplicate result.

Note that for RPDs the result can be a positive or a negative value. RPDs are often presented as *absolute* RPDs, in which case the absolute value of the RPD is reported, always resulting in a positive number. Reporting the absolute RPD results in a reduction in information, since, for instance, if a duplicate sample consistently returned higher results than the original sample, all RPD values would be negative and it may be an indication of a precision problem. In this case, if absolute RPD was reported, no indication would be forthcoming.

Total precision was determined by collecting field duplicate samples. These samples were collected and analyzed at a rate of approximately 10% of total samples for each analytical suite.

Analytical precision will be determined in the laboratory by running matrix spike/matrix spike duplicate (MS/MSD) pairs, or by running laboratory duplicate analyses. These samples will be analyzed at a rate of approximately 5% for each analytical suite.

Accuracy

Accuracy is a statistical measurement of correctness and includes components of random error (*e.g.,* variability due to imprecision) and systematic error (*e.g.,* bias). Therefore, accuracy reflects the total error associated with a measurement. A measurement is accurate when the value reported does not differ beyond acceptable limits from the true value or known concentration of the spike or standard. Acceptance criteria are indicated in the individual standardized analytical methods.

Analytical accuracy is typically measured by determining the percent recovery of known target analytes that are spiked into a field sample (*i.e.,* a surrogate or matrix spike), or reagent water (*i.e.,* laboratory control sample [LCS] or blank spike) before extraction at known concentrations. Percent recovery is calculated as:

$$\%REC = \frac{A}{B} \times 100$$

where:

A	=	obtained value
B	=	true value.

Analytical accuracy was determined in the laboratory by the running of MS samples or laboratory control samples. These samples were analyzed at a minimum rate of 5% for each analytical suite.

Completeness

Completeness for this investigation was defined as the percentage of valid analytical results. Results made uncertain due to missed hold times, improper calibration, blank contamination, or poor calibration verification results would be deemed invalid. Results that may be flagged due to matrix effects are not considered invalid. Completeness for projects should exceed 90%. Completeness is calculated by:

$$completeness = \frac{A}{B} \times 100$$

where:

A	=	number of valid analytical results
B	=	total number of analytical results.
