the 1990s, the number of people in the world who are under 15 years of age is expected to increase from 1.1 billion to 1.5 billion.

As the world's population grows, the demand for food and other resources will increase. This will put pressure on the environment and on the world's food supply. It is important that we find ways to meet this demand without harming the environment or the world's food supply.

One way to do this is to use sustainable agriculture. Sustainable agriculture is a way of farming that uses natural resources in a way that will not harm them for future generations.

Another way to do this is to use sustainable forestry. Sustainable forestry is a way of managing forests that will ensure that there are always enough trees to provide us with the products we need.

There are many other ways to meet the world's growing demand for food and other resources without harming the environment or the world's food supply. It is up to us to find the best way to do this.

One of the most important things we can do is to make sure that we are using resources in a sustainable way. This means that we are using them in a way that will not harm them for future generations.

Another important thing we can do is to make sure that we are using resources in a way that will not harm the environment. This means that we are using them in a way that will not pollute the air, water, or land.
